

ANNUAL REPORT

Program Year 2013

July 1, 2013 - June 30, 2014

Hawaii Energy

YOUR CONSERVATION & EFFICIENCY PROGRAM

Annual Report

Program Year 2013

July 1, 2013 – June 30, 2014

This report was submitted to the Hawaii Public Utilities Commission on November 21, 2014 by:

Hawaii Energy (Leidos Engineering)
Public Benefits Fee Administrator
1132 Bishop Street, Suite 1800
Honolulu, Hawaii 96813

Hawaii Energy is a ratepayer-funded conservation and efficiency program administered by Leidos Engineering, LLC under contract with the Hawaii Public Utilities Commission serving the islands of Hawaii, Lanai, Maui, Molokai and Oahu.

» A MESSAGE FROM THE PROGRAM DIRECTOR

On behalf of the entire Hawaii Energy Team, we are proud to submit our Program Year 2013 (PY13) Annual Report, covering July 1, 2013 through June 30, 2014 and highlighting our fifth year as Hawaii's Public Benefits Fee Administrator (PBFA).

This has been another successful and progressive year for energy efficiency in Hawaii. As detailed in this Report, Hawaii Energy's efficiency programs for PY13 will deliver 1.75 billion kWh in lifetime energy savings to the electric grid system at a total program cost of 1.8¢ per kWh (total program costs / total system kWh benefit). This, in turn, will save an estimated equivalent of 2.6 million barrels of oil and 1.5 million tons of greenhouse gas emissions. And, at an average electric utility price of 32.8¢ per kWh, customers will save approximately \$517 million on their electric bills over the life of the installed efficiency measures. These figures continue to show the exceptional cost-effectiveness of investing in energy efficiency and why ***efficiency continues to be Hawaii's premier electric grid resource***, over fossil and renewables.

In addition to meeting our PY13 kWh savings goals at a very attractive cost for our customers, Hawaii Energy made further organizational restructuring and team additions to better facilitate the development and implementation of forward-looking strategies and innovative new measures. We also continued to enhance our customer engagement and build on existing collaborative relationships with our industry allies, Contract Manager, M&V Contractor, Hawaii Public Utilities Commission (PUC) and government leaders. Together, these efforts will help ensure that Hawaii Energy continues to provide best-in-class energy conservation and efficiency programs as required for Hawaii's changing energy future.

Operationally in PY13, Hawaii Energy continued its aggressive engagement with hard-to-reach residential and business customers on neighbor islands; helped more underserved small businesses participate with our Direct Install Lighting Program; accelerated facility-wide LED retrofit, benchmarking and metering programs for Hawaii's large buildings; and continued development of multi-island opportunities to assist water and wastewater operations with energy efficiency upgrades and practices, including publication of a Water & Wastewater Best Practices Manual for Hawaii.

Most significantly this Program Year, Hawaii Energy (as PBFA) designed and built the intake infrastructure and process to support the PUC's bold On-Bill Financing (OBF) initiative, which is expected to be a catalyst for giving all Hawaii electricity consumers a real opportunity to participate directly in the benefits of Hawaii's clean energy future. And at the end of our Program Year, we were quite pleased to be informed of the PUC's intention to extend our PBFA contract for a third year, until December 31, 2016. This convergence of our team's continued service and proven capability as PBFA, along with the PUC's new initiatives, an encouraging market potential study released this year and the strong working relationships we have established thus far promise transformational advances in Hawaii's clean energy progress going forward.

Finally, this Report caps five years of progressive transition from the original legacy rebate program to an innovative, responsive and effective energy efficiency program today that is providing much needed leadership and expertise in accelerating Hawaii's clean energy future.

Respectfully submitted,

A handwritten signature in black ink that reads "H. Ray Starling". The signature is written in a cursive, flowing style.

H. Ray Starling
Program Director

» BACKGROUND

Program Origins

In 2006, the Hawaii Legislature (see Hawaii Revised Statutes §269-121 through 269-124) authorized the PUC to transfer the existing demand-side management (DSM) surcharge collected by Hawaii's electric utilities to a third-party administrator that would be contracted by the PUC. The transferred surcharge would be called the Public Benefits Fee and would be used by the contracted third-party administrator (the Public Benefits Fee Administrator or the PBFA) to manage and deliver energy-efficiency and demand-side management programs and services under the oversight of the PUC.

By Decision & Order # 23258 (Docket No. 2005-0069) dated February 13, 2007, the PUC announced it would establish a Public Benefits Fund to promote the development of programs and services that increase energy efficiency, reduce electricity consumption and demand, and ultimately decrease Hawaii's dependence on imported fossil fuels. In 2008, the PUC took further actions to direct the Hawaiian Electric Companies to begin collecting a Public Benefits Fee (PBF) surcharge.

On September 18, 2008, the PUC issued a competitive Request for Proposal (RFP) soliciting proposals and pricing for a Program Administrator for the Hawaii Energy Efficiency Program. Science Applications International Corporation (SAIC) submitted a proposal and was subsequently selected to negotiate a contract with the PUC. As a result of those negotiations, a contract was signed on March 3, 2009 between the PUC and SAIC whereby SAIC would become Hawaii's first PBFA and would operate the Hawaii Energy Efficiency Program until December 31, 2013 (with a possible extension until December 31, 2016 at the discretion of the PUC). The initial two-year budget of the contract was \$38.4M, followed by a second two-year budget of \$67.2M. For both contracts, 70% of the contract value was designated for direct incentives in the form of direct cash incentives or services.

The complete Program Historical Summary (2009 - 2012) is provided in Attachment G.

PROGRAM OVERVIEW, OBJECTIVES & ORGANIZATION

Current Year Program Overview

PY13 – Expansion of Program Reach and Harvesting Results from Prior Years Program Assistance

In our fifth year, Hawaii Energy pushed harder than ever to drive the effectiveness of the PBFA investments.

Expanding Reach

- Expanded Water & Wastewater industry assistance and used this as a model to expand our impact to other targeted sectors.
- Providing Program communications, not only through traditional advertising, but through innovative Transformational efforts such as Internet memes and low-cost PR efforts.

Harvesting Longer-Term Efforts

- AOA submetering projects are a long-lead effort and are continuing to grow to project fruition.
- Large LED projects in which Hawaii Energy engages as a valued partner for participants are often more valuable than the technology and incentives alone.
- The SWH Tune-Up piloted in PY11 was evaluated for efficacy and launched with great success.
- Program improvements to SBDIL can be used to further monitor and refine existing programs

Tuning Programs to Meet Market Conditions

- Hawaii Energy modified the Small Business Direct Install Lighting (SBDIL) program to increase cost effectiveness by restricting T8 retrofits to T12 baselines. By making this modification, the program hopes to grow the SBDIL Contractors from 10 in PY13 to potentially 23 in PY14. In addition, the program continued to refine the automated tools and speed payment for the contractors, as well as played a critical role in dispute resolution for technical and construction performance. The challenge remains to continue to modify the program to both keep the contractors financially interested in participation and keep the SBDIL project costs a competitive part of the measure portfolio.
- The Water and Wastewater program was successful this year in rolling out our *Water & Wastewater Energy Management Best Practices Handbook* (available online at www.hawaiienergy.com/water-and-wastewater). This manual was customized for Hawaii and was coordinated with the release of the *State of Hawaii Water Commission's Training and Water Loss Manual* and training sessions. In addition, Hawaii Energy was engaged across State, Federal and County agencies to assist in the research and discussion of administrative solutions to barriers of project implementation and operational changes. One project can have the potential to save between 7,200,000 kWh and 21,000,000 kWh and \$2 - 5 million dollars per year starting in 2014 depending on the outcome of permitting rules put into place at the end of this year. To encourage treatment facility lighting projects in the specialized industrial environment, Hawaii Energy assisted in the selection of LED replacement fixtures for a Maui County wastewater facility resulting in better light quality and quicker restrike to allow the fixtures to be turned off. The project outlined the need to address the challenges of fixture accessibility and awareness of the availability of LED purpose built fixture offerings.

» PROGRAM OVERVIEW, OBJECTIVES & ORGANIZATION

Making Investments

- *People* – PY13 saw the organization reach full staffing levels to help the Program better engage with customers, HECO and up-and-coming energy and efficiency coordination efforts in PY14 (EV, DR, Smart Grid, Codes and Standards).
- *Technology* – Created OBF Web tools, data exchange services and Contractor Administration services that will be leveraged for new Energy Efficiency program offerings.
- *Data* – The program expanded its efforts in data analysis for market segmentation in order to provide valuable information and attract engagement with potential participants. Hawaii Energy purchased facility information data from Hawaii Information Systems (HIS) that incorporated information in Tax Map Key (TMK) and in Multiple Listing Services (MLS) data on properties. This data was correlated with the electrical usage histories and Geographic Information Systems (GIS) data to provide benchmark information for Hawaii. This information will be used to target and engage market segments with greater focus and effectiveness.
- *Spending Time with Customers* – The program drove major LED lighting projects by engaging with potential customers and lighting professionals, providing technical evaluation and following site procurement actions to ensure any hurdles were corrected with incentives, coordination or other Program assistance. Additional savings were achieved beyond the LED efficiency by application of networked controls with daylight and occupancy detection. The success of exterior lighting projects drove participants to follow their success with interior lighting retrofits and allowing their sites to be used as references for lighting manufacturers and retrofit professionals.
- Expanded the residential programs by leveraging the expertise and customer base of existing assistance programs.

» PROGRAM OVERVIEW, OBJECTIVES & ORGANIZATION

Residential Programs

Residential portfolio spent \$9,230,037 (97% of target), and achieved 71,239,576 kWh savings (99% of target), 9,493 kW peak demand savings (96% of target) and \$68,617,110 in Total Resource Benefit (94% of target).

| Implementation | Achievement |
|--|---|
| Created the Bounty Rid-A-Fridge program in partnership with the Hawaii Foodbank (Oahu), The Maui Food Bank and The Food Basket (Hawaii Island). | Over \$3,000 was donated to the participating food banks through this program |
| Continued to diversify measure portfolio away from CFLs. | 277,589 LEDs in PY13, an increase of 310% from PY12. |
| Extended the Solar Water Heating Grant partnership to include both Hawaii Community Economic Opportunity Council (HCEOC) and the Maui Economic Opportunity, Inc. | A total of 52 solar water heating systems were installed for “in-need” homes on Maui and Hawaii Island. |
| Expanded the Peer Group Comparison program to 57,500 additional households on Oahu. | 132,500 recipient households receiving customized energy saving tips and month-to-month tracking progress on their electricity usage. |
| Grew Solar Water Heating program trade ally base to 89 Participating Contractors | 2,185 systems |
| | Launched co-op advertising program for solar water heating participating contractors to receive advertising funds. Four (4) contractors participated and a total of \$6,000 was reimbursed for their advertising. |
| Released and refined a Solar Water Heating Tune-Up Program based on feedback from the PY11 Tune-Up Pilot. | The Tune-Up program far surpassed expectations rebating 826 tune-ups performed in four months. |
| Collaborated on Hui Up with Blue Planet Foundation and Sust’AINable Molokai to coordinate efforts to help residents exchange and recycle their old, inefficient refrigerators for heavily rebated ENERGY STAR® refrigerators. | Distributed 220 refrigerators to “in-need” households in Molokai through the Hui Up program. |
| Launched bi-monthly residential e-newsletter highlighting the program, res offers and rebates. | Grew opt-in list of engaged subscribers to 9,000 emails. Average open rate was 35%, which is the number of recipients who viewed the email. |

PROGRAM OVERVIEW, OBJECTIVES & ORGANIZATION

Business Programs

Business portfolio spent \$11,194,615 (96% of target), and achieved 55,765,938 kWh savings (77% of target), 7,294 kW peak demand savings (89% of target), and \$87,925,661 in Total Resource Benefit (83% of target).

| Implementation | Achievement |
|---|---|
| Increased incentive for Electrically Commutated Motors (ECM) with a push to increase awareness for this promising measure. | Successfully drove a large resort property to install ECMs in all 1,300 guestrooms and receive a \$72,050 incentive. |
| Developed new incentive for large energy-efficient Uninterruptible Power Supply (UPS) systems. | A Higher Education Data Center received \$55,575 incentive for the installation of a new UPS system achieving significant savings produced by the 8,760 hour per year operation, 413,000 kWh per year and 47 kW. |
| Harvested the results from years of work in the Condo Submetering program promoting equitable distribution and created direct financial responsibility of electrical consumption. | 11 more condo and apartment complexes totaling 2,364 units. The largest project resulted in an \$111,000 incentive for the submetering of 740 dwelling units reducing their energy consumption by over 179,000 kWh/year and demand by 21 kW. |
| Drove major LED Exterior Lighting projects with technical and financial assistance. | <ul style="list-style-type: none"> \$455,489 incentive motivated a large retail mall to do a LED replacement of old metal halide fixtures throughout the parking structure achieving cost savings of \$702,000 per year, 2,679,000 kWh per year and 201 kW. \$43,786 incentive to the County of Hawaii for converting 857 of their low pressure sodium streetlights to LED streetlights saving \$145,000, 360,000 kWh/year and reduced demand by 55 kW. |
| Assisted in Innovative and Specialized Retrofits | \$91,484 incentive for the installation of a high efficiency rotary plastic bottle blower used to inflate plastic blanks inside of a shape mold. The old machine exhausted the compressed air after each bottle was pressed into the mold. The new machine recaptures compressed air, substantially reducing energy consumption by 600,000 kWh a year. |
| Continued success in Commercial Water Pumping Improvements | A \$202,048 incentive to a Maui resort hotel for the installation and redesign of all of their water pumps on their pools and water features expected to save over 1,000,000 kWh per year and reduce demand by about 140 kW, saving the resort over \$300,000 per year. |
| Refined Direct Install program | 545 small businesses and restaurants were served, providing annual energy savings to these customers of over 4.5 million kwh. |
| Launched quarterly business e-newsletter highlighting the program, business offers and rebates. | Grew opt-in list of engaged subscribers to over 700 emails. Average open rate was 40%, which is the number of recipients who viewed the email. |
| Highlighted the successes of local businesses that have utilized the program and received incentives for their energy efficiency efforts by promoting them through check presentations . | A total of seven (7) local businesses were featured in check presentations and a monthly <i>Hawaii Business Magazine</i> ad. First program year where we brought public relations in-house. This enabled us to promote the program more efficiently and effectively to the local media. |

PROGRAM OVERVIEW, OBJECTIVES & ORGANIZATION

Transformational Programs

Through the expertise and collaboration of Hawaii Energy and its subcontractors throughout PY13, the Transformational Program met and exceeded its goals for the Program Year.

| Implementation | Achievement |
|--|---|
| “Sharing the Aloha” community workshop expansion with the addition of sessions held at large employers such as resorts, hospital and non-profits. | Achieved a new high of 3,101 attendees. |
| Memes – Worked with Kanu Hawaii to develop and distribute various energy-saving topics in the form of “memes,” an item in the form of an image, video, phrase, etc., that is spread via the Internet and often altered in a creative or humorous way. | <ul style="list-style-type: none"> • In three months, memes resulted in 614,542 social media views of which 19,394 people took the next step and engaged in an action to read more, share, comment, view video, etc. • This approach to engage through social media, bring energy efficiency to new viewers, will be used to drive future participation of Hawaii Energy’s offerings. |
| Pay it Forward - Piloted an offering with Kanu Hawaii to teach people how to use a simple mechanical plug timer to save energy by controlling “vampire loads” and then get those participants to help others do the same. | <ul style="list-style-type: none"> • Reached over 20,000 Hawaii residents via email and social media and got 1,035 responses. • Written installation instructions based on Hawaii-styled phrasing and photos produced the best install rates. • Photos of the installed plug timers provided verifications. • 38% posted their experience on social media. |
| Expanded Professional Training with the introduction of online recorded workshops providing participants from all islands access to training. | Achieved a new high of 1,336 participants. |
| The Building Operator Certification (BOC) courses had success in improving the recruitment of an appropriate audience. | 51 well-qualified participants. The training was so effective that employers specifically requested an offering of BOC Level 2. |
| Followed the advice from the Teacher Advisory Board to allow educators to hold Energy Expos at their schools inviting the community to learn about conservation and efficiency from student-led NEED.org activities. | Reached 338 teachers through energy workshops, enriching the education of over 18,000 students. |
| Orchestrated a major press conference on September 19, 2013 with the Hawaii National Guard. | The conference generated significant media coverage. It was held in recognition of the Hawaii National Guard’s efforts to reduce energy consumption and become more energy-efficient. Featured speakers were Governor Neil Abercrombie, Major General Darryll D.M. Wong and Hawaii Energy Program Director Ray Starling. |

>> PROGRAM OVERVIEW, OBJECTIVES & ORGANIZATION

On-Bill Financing Program

Hawaii Energy provided the PUC with OBF program development support focused on: Program Management, Contractor Management, IT Solutions, and Marketing & Outreach. Hawaii Energy also worked closely with the other program entities - HECO and AFC First (Finance Program Administrator) - on process and IT system design issues, as well as the OBF Working Group on refining program parameters.

PY13 involved the development of numerous deliverables in support of the Program Administration role and final program parameters will be finalized upon the Investor selection and the late 2014 launch date.

Significant activities in PY13 included the following:

Program Management

- Development of the Program Administrator Operations Plan to define processes for customer and contractor eligibility, completion of energy assessments, and assessment criteria for submitted projects.
- Support to PUC staff on the development of the OBF Program Manual.
- Provided issue papers and presentations to facilitate discussions and to drive recommendations for program development.

Contractor Management

- Development of all Energy Assessment and project submission forms.
- Development of contractor training materials, training plan and the contractor-driven application process.
- Gathered industry feedback through several interactive sessions with solar water heater contractors and suppliers.

IT Support

- Create OBF information website to provide customer-facing information on the program.
- Built OBF contractor portal to provide an online project submission, tracking and approval tools.
- Interface with AFC First for rapid, cost effective web-based service solutions for processing project applications.
- Development of solar water heating and residential air conditioning estimated energy savings calculators.

Marketing & Outreach

- Presented Marketing & Outreach Plan discussing specific actions for supporting a contractor-centric marketing approach along with Hawaii Energy's direct engagement of specific hard-to-reach market segments.
- Outlined OBF marketing brochures to support customer education and engagement through both contractor driven marketing and Hawaii Energy outreach efforts.

» PROGRAM OVERVIEW, OBJECTIVES & ORGANIZATION

Achievements

- The Program invested a total of \$32,049,855 to deliver 1,749,955,694 kWh (system-level) over the measure lives resulting in a cost per kWh of \$0.0183.
- Delivered \$20,424,652 in incentives driving customer bill savings of \$49,510,256 annually and over \$517,191,593 over the life of the measures installed. See **Table 1** for details of customer energy cost savings by island and rate tariff.
- A first year Program level savings of 127,007,811 kWh.
- Diversified portfolio away from reliance on CFLs by 15.4%, while increasing LEDs by 191%.

| Table 1 Customer Energy Cost Savings by Island | | | | | | | | | |
|---|----------------------|---------------------|---------------------|----------------------|---------------------|--------------------|----------------------|----------------------|-------------------|
| First-Year Energy Cost Savings | | | | | | | | | |
| Island | R | G | J | P | DS | F | Total | kWh - 1st yr | Avg. Cost \$/kWh* |
| Oahu | \$19,903,830 | \$1,179,897 | \$5,909,233 | \$6,712,143 | \$2,627,466 | \$28,041 | \$36,360,610 | 112,806,380 | \$0.322 |
| Hawaii | \$4,791,090 | \$233,647 | \$743,796 | \$750,702 | \$0 | \$164,026 | \$6,683,261 | 16,363,022 | \$0.408 |
| Maui | \$4,005,836 | \$134,740 | \$469,202 | \$1,741,015 | \$0 | \$0 | \$6,350,792 | 16,829,320 | \$0.377 |
| Molokai | \$56,573 | \$2,012 | \$0 | \$0 | \$0 | \$0 | \$58,585 | 118,838 | \$0.492 |
| Lanai | \$21,635 | \$35,372 | \$0 | \$0 | \$0 | \$0 | \$57,007 | 114,701 | \$0.497 |
| Total | \$28,778,964 | \$1,585,668 | \$7,122,231 | \$9,203,860 | \$2,627,466 | \$192,068 | \$49,510,256 | 146,232,261 | \$0.338 |
| Customer Lifetime Energy Cost Savings | | | | | | | | | |
| Island | R | G | J | P | DS | F | Total | kWh - Lifetime | Avg. Cost \$/kWh* |
| Oahu | \$152,749,397 | \$15,787,155 | \$82,461,537 | \$95,484,969 | \$45,208,173 | \$346,144 | \$392,037,376 | 1,254,377,140 | \$0.31254 |
| Maui | \$28,864,153 | \$1,899,151 | \$7,210,337 | \$25,963,686 | \$0 | \$0 | \$63,937,328 | 172,473,649 | \$0.37071 |
| Hawaii | \$34,303,853 | \$3,243,438 | \$10,095,406 | \$9,942,227 | \$0 | \$2,460,394 | \$60,045,317 | 149,762,891 | \$0.40094 |
| Molokai | \$589,520 | \$29,306 | \$0 | \$0 | \$0 | \$0 | \$618,826 | 1,254,686 | \$0.49321 |
| Lanai | \$57,537 | \$495,209 | \$0 | \$0 | \$0 | \$0 | \$552,746 | 1,092,020 | \$0.50617 |
| Total | \$216,564,460 | \$21,454,260 | \$99,767,280 | \$131,390,882 | \$45,208,173 | \$2,806,538 | \$517,191,593 | 1,578,960,387 | \$0.32755 |

*Average per kWh customer electric cost based on actual participants' total bill energy costs for calendar year 2013.

>> PROGRAM OVERVIEW, OBJECTIVES & ORGANIZATION

Lessons Learned

The Business Program successfully integrated interns to support post-inspections for the Small Business Direct Install Program. This provided interns with valuable exposure to the energy efficiency industry while expanding the Program's capacity. This resource also provided better customer feedback to help the Program improve this offering in PY14 while building awareness of the Program throughout the small business community.

The Residential Program encouraged participation from new lighting manufacturers and retailers, both small and large, by simplifying the application process. Program representatives engaged lighting participants via phone and on the ground at retail locations. This resulted in a number of new lighting products being rebated throughout PY13.

The Transformational Program focused on improving the learning experience for all workshop participants through the thoughtful selection of well-qualified attendees and through extending the reach of our offerings across the five islands. With all programs, mindful attention was given to cost-effectively scale the offerings to reach more people, with particular attention to island equity and hard to reach communities. An important enhancement for the coming year is to deepen the learning through repeated contact with targeted customers, offering advanced training opportunities, and piloting new programs to further reach and encourage improved energy engagement across the state.

Significant Event(s)

The Business Program maintains a full calendar of meetings and events, both large and small that educate prospective participants on the many energy efficiency opportunities their businesses and facilities provide. The team also engaged professional associations throughout the year and is meeting often with technology vendors to stay current on new technologies, present Program developments and solicit ideas and feedback. While over seventy events were reported throughout the year, this is but a fraction of the Business Programs engagement with the business community and the vendors that support them.

In PY13, the Residential Program hosted eight (8) solar water heating contractor meetings. These meetings had a total audience of almost 200 people. They served as an opportunity to present Participating Contractors with Hawaii Energy's new initiatives, like the Cooperative Marketing program, and gather feedback regarding current industry trends in solar water heating.

A significant event for the Transformational Program was the University of Hawaii (UH) and Hawaii Energy "Energy Solutions Leadership Reception" that took place on May 8th, 2014. This event engaged keynote speaker and Hawaii Energy trainer, Mark Jewell, with an assembled group of approximately fifty leaders that included members of the UH Board of Regents, UH system and campus administrators, and facilities managers. It was an important engagement with a large, state institution that has helped to catalyze momentum to develop a comprehensive energy efficiency strategy for the University.

» PROGRAM OVERVIEW, OBJECTIVES & ORGANIZATION

Program Objectives

In addition to the PBFA Contract requirements and performance award goals, the Program's broader objectives for PY13 included:

- Reduce the State's demand for electricity, and by doing so, decrease the State's dependence on imported fuel.
- Expand the Program's outreach to the neighbor islands and other hard-to-reach constituents.
- Support the Hawaii Clean Energy Initiative and related efforts aimed at improving Hawaii's energy sustainability.
- Leverage strategic agencies and allies as "force multipliers" to extend the Program's outreach.
- Serve as one of the State's critical leaders, advocates and sources of information for energy conservation and efficiency efforts.
- Explore new innovative strategies in energy conservation and efficiency.
- Evolve the Program to affect behavior change through transformational programs, peer comparisons and enhanced information to increase personal awareness of energy consumption, as well as traditional cash incentives for implementing energy efficiency measures.
- Reach out to small businesses on a more individualized basis to enhance their viability as a going concern during the current economic downturn.

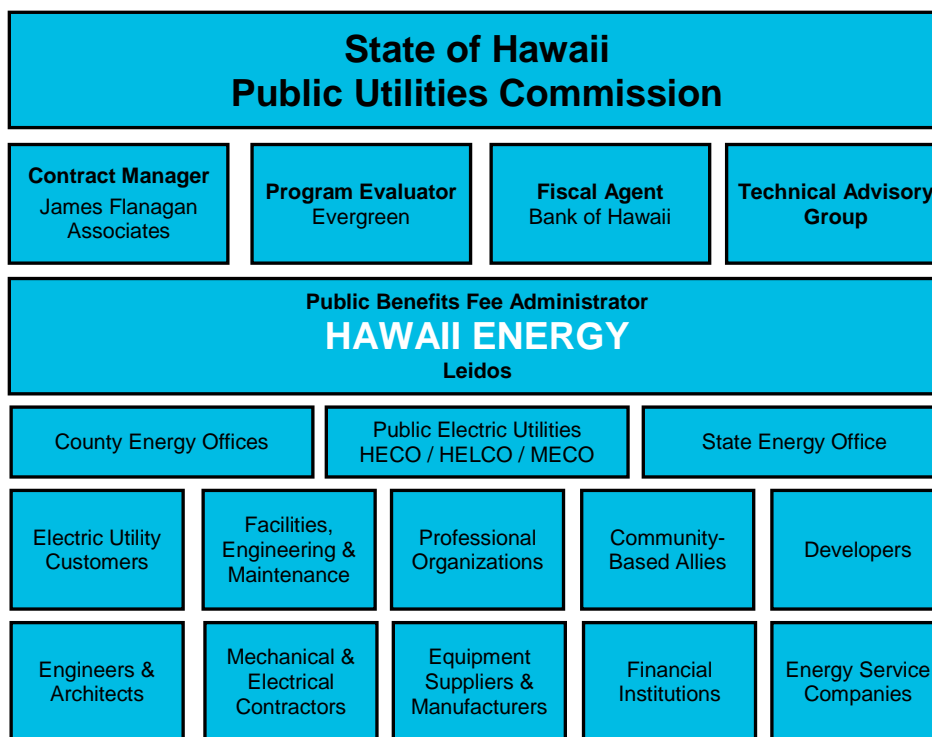

» PROGRAM OVERVIEW, OBJECTIVES & ORGANIZATION

Oversight and Support

During PY13, the PBFA collaborated with a wide variety of support organizations and oversight entities. These oversight entities were comprised of the PUC, Contract Manager (James Flanagan Associates), Program Evaluator (Evergreen Economics), Fiscal Agent (Bank of Hawaii) and a Technical Advisory Group (TAG). The TAG is made up of local energy stakeholders who provide their expertise, technical guidance and support to ensure success of the Program. Together with the Program's supportive trade allies and community groups, Hawaii Energy continually worked to improve the accountability, functionality, offerings, efficiency and cost-effectiveness of the Program. Program oversight and support operatives are shown in **Figure 1**.

Figure 1 – Program (PBFA) Oversight and Support Organizations

» PROGRAM OVERVIEW, OBJECTIVES & ORGANIZATION

The foundation of the Program's organization is a core team of Leidos professionals in Honolulu, supported by off-site staff of uniquely skilled professionals throughout Leidos' organization nationwide. The Program also has a number of key subcontractors that together round out the Hawaii Energy team. These key subcontractors are:

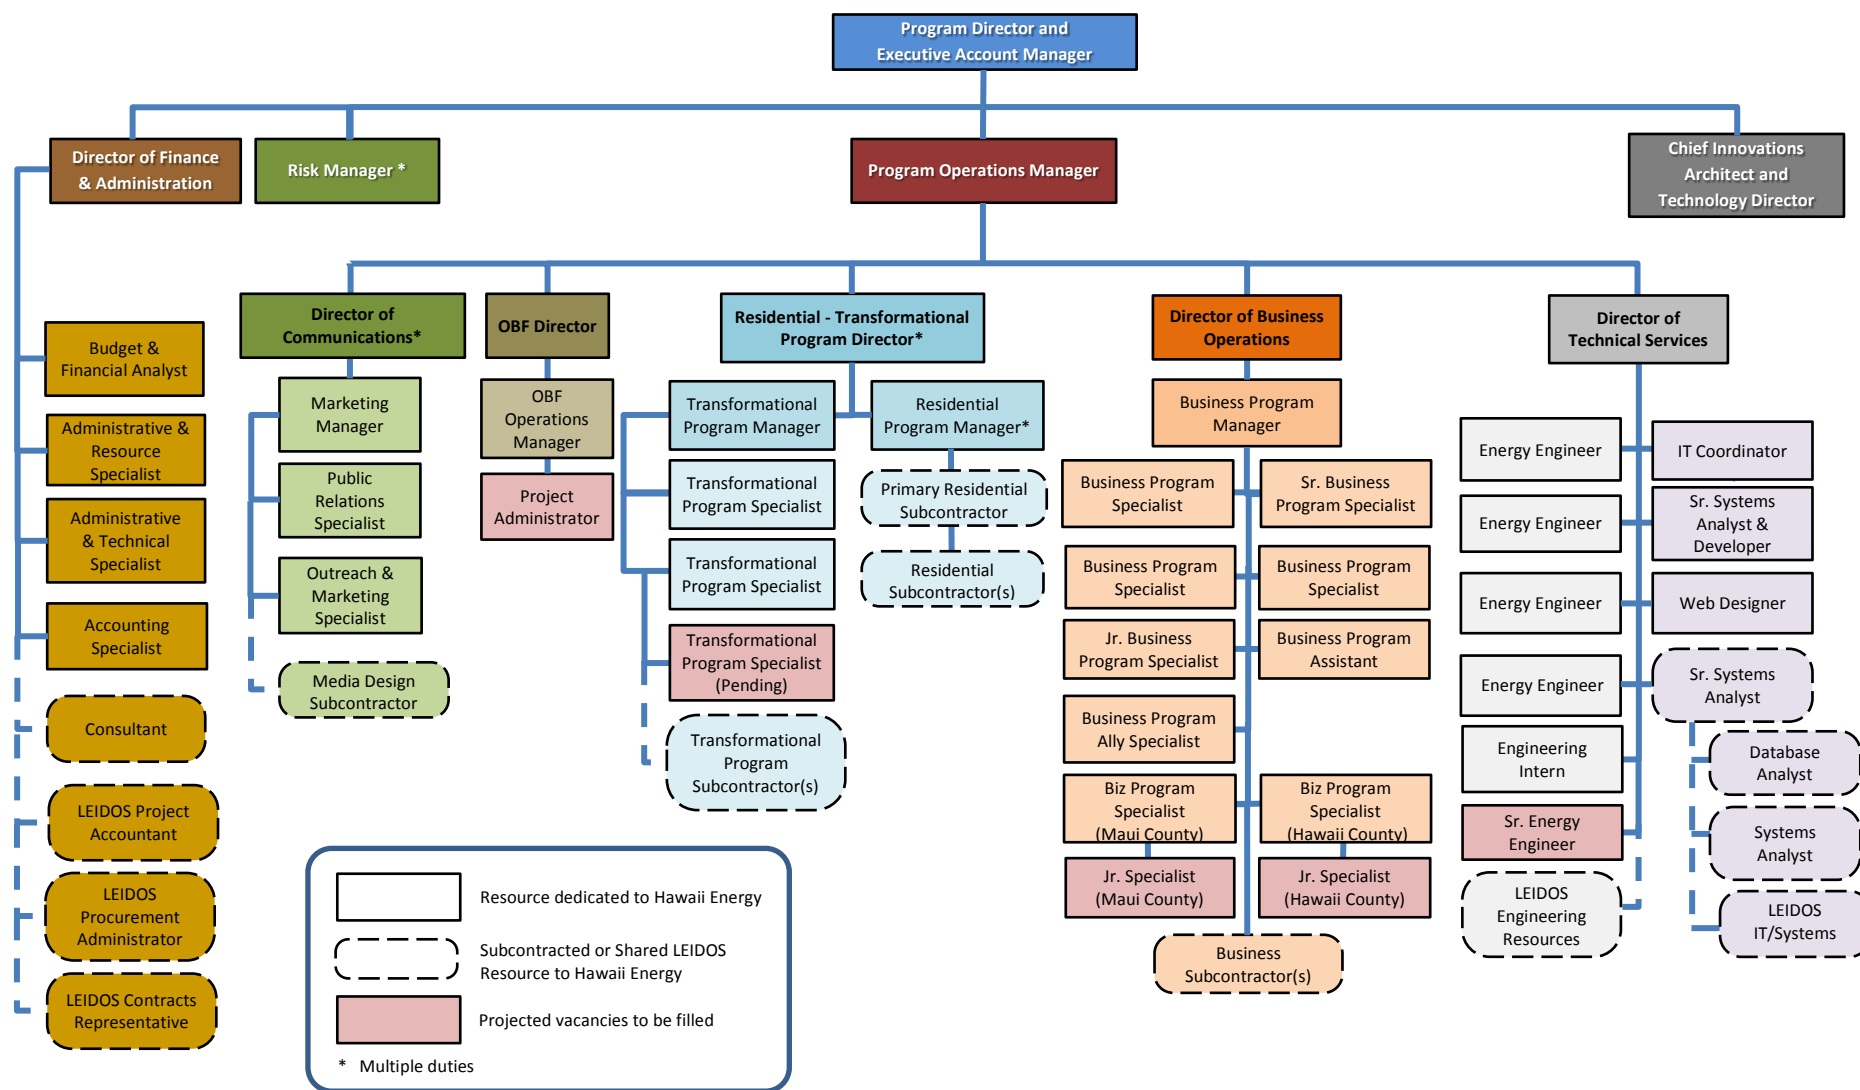

- **Association of Energy Engineers (AEE)** – Provided technical training for Certified Energy Managers and Certified Energy Auditors.
- **Blue Planet Foundation** – Conducted Molokai Hui Up 3.0 (refrigerator trade-up program).
- **EEFG, Inc.** – Provided education, training, coaching and analysis to help energy users and service providers realize and express the true value of improving energy efficiency.
- **Helen N. Wai, LLC** – Provided training to assist communities and organizations in the areas of financial literacy and energy efficiency.
- **Home-Tech** – Provided solar water heating systems and commercial equipment inspections on Hawaii Island.
- **Honeywell** – Provided customer service and administrative functions to support the residential programs and provides check processing services for both residential and business incentive programs.
- **JN Plumb Tech** – Provided solar water heating systems and commercial equipment inspections on the islands of Lanai, Maui and Molokai.
- **Kanu Hawaii** – Provided transformational messaging and Pay-It-Forward (timer lending initiative) implementation support.
- **Kupu** – Provided energy efficiency interns for Program through Rewarding Internships for Sustainable Employment (RISE) program.
- **National Energy Education Development (NEED) Project** – Provided training for teachers to understand and be better able to teach energy efficiency in K-12 schools.
- **Opower** – Provided peer group comparison Home Energy Reports to residences in Maui County, Hawaii County and select parts of Honolulu County.
- **University of Hawaii Outreach College** – Provided technical training for building operators through their existing Continuing Education programs.
- **Wall-to-Wall Studios** – Provided online and advertising creative design services and media placement.

PROGRAM OVERVIEW, OBJECTIVES & ORGANIZATION

Program Organization

The Program's organization at the end of PY13 (including pending hires) is shown in the chart below:

Figure 2 – Program Organizational Chart
(as of June 30, 2014)

PERFORMANCE INDICATOR RESULTS

Program Performance Indicators and Related Targets

Overview

The following Performance Indicators were established in the PBFA Contract in order to set measureable performance targets that meet the PUC's objectives and to provide the basis for financial incentives as a reward for superior performance in achieving explicit Program goals. The Performance Indicators for PY13 are:

1. Cumulative Annual Electric Energy Savings (Program Level)
2. Peak Demand (Program Level)
3. Total Resource Benefit (Program Level)
4. Market Transformation
5. Island Equity (Broad Participation)

Table 2 defines the minimum, target and maximum award levels for each Performance Indicator used to measure the Program's performance.

Details of each indicator and its related target follow.

| Table 2 Performance Indicators | | | | |
|-----------------------------------|--------------------------|---------------|---------------|---------------|
| Indicator | | Minimum | Target | Maximum |
| First Year Energy Reduction (kWh) | | 106,212,107 | 141,616,143 | 155,777,757 |

» PERFORMANCE INDICATOR RESULTS

Performance Indicator #1: Cumulative Annual Electric Energy Savings (Program Level)

Target: 141,616,143 kWh

Annual Electric Energy Savings directly benefit the State's goal of achieving energy independence by reducing the consumption of imported fossil fuels in proportion to the fossil-fueled units used to serve this load. The program participants directly benefit through lower electricity costs.

The Program Level Energy Savings Target of 141,616,143 kWh currently equates to 1,595,492 MMBTUs or avoided use of 260,782 bbls of liquid fossil fuels in Hawaii, see **Table 3**.

» PERFORMANCE INDICATOR RESULTS

Performance Indicator #2: Peak Demand Savings

Target: 17,821 kW

Peak Demand Reduction is focused on reducing the electrical load during the traditional peak demand period between 5:00 p.m. and 9:00 p.m. on weekdays, as illustrated in **Figure 3**. System Demand Load is typically highest when humid nights increase air conditioner usage in addition to the normal evening water heating loads. This system peak load is used to plan the requirements for additional generation capacity. Reducing the load reduces the cost to the utility customer by deferring the need for an additional unit of generation. Aggressive peak load reductions and load shifting technologies may allow for the retirement of less efficient generation units as more renewable generation is available.

Program participants benefit from lower electrical costs and all customers benefit from the avoided cost to provide additional units of generation to meet increasing electrical peak demand. The target of 17,821 kW is equivalent to the power required to operate 4,642 water heaters at 4 kW each.

Figure 3 – Typical Daily System Demand (Load) Profile

>> PERFORMANCE INDICATOR RESULTS

Performance Indicator #3: Total Resource Benefit (TRB)

Target: \$177,013,974

The Total Resource Benefit (TRB) is the estimated total net present value (NPV) of the avoided cost for the utility from the reduced lifetime demand (kW) and energy (kWh) from energy efficiency projects and measures. The utility costs were determined using average avoided cost data for installed capacity to meet demand and cost to produce energy that was provided by HECO IRP4 and adjusted under the advice of the Contract Manager. Average annual avoided cost for capacity and energy for calendar year 2013 escalated for a 20-year period was the basis for the analysis. The TRB incorporated avoided transmission and distribution costs into the avoided energy and capacity costs. The time value of money is represented by a discount rate of 6%. The discount rate is used to convert all costs and benefits to a “net present value” for comparing alternative costs and benefits in the same year’s dollars.

Table 4 provides an example of the TRB calculation as if a hypothetical project consisted of a single measure with a nine (9) year life achieving the program demand (kW) and energy (kWh) targets. In the implementation of specific Program measures, individual calculations are done for each measure then summed together to determine the Program’s TRB result.

Table 4
Example of the TRB Calculation using Look Up Table

| Life | | | | | | | | | kW Target | kWh Target | | Project Cost |
|------|--------------|----------------|----------------------|------------|-------------------|------------|----------------|------------|------------------|----------------|------------------------|---------------|
| 8 | | Discount Rate | | | | | | | | 25.0 | 25,000 | \$ 45,000 |

>> PERFORMANCE INDICATOR RESULTS

Performance #4: Market Transformation

Target: Two Tasks in each of the Four Categories

Transformational efforts are those that involve education, training and other legislative support activities that may not result in direct quantifiable energy savings. The focus of this year’s target is to develop community partnerships to leverage their reach and expertise in delivering energy education to specific “hard-to-reach” communities and industries. These efforts contribute to development of an infrastructure and mindset that will result in societal changes and increased energy savings in the future.

Figure 4 provides a summary of the Market Transformation programs for PY13.

Figure 4 – Summary of Transformational Programs

| | | |
|--|--|----------------------------------|

» PERFORMANCE INDICATOR RESULTS

Performance #5: Island Equity (Broad Participation)

Target: +/- 20% of each County's contribution to the PBF

The Island Equity target is intended to promote the equitable participation in the Program among the counties. For PY13, “equitable” would achieve the goal that for every dollar contributed to the PBF, a dollar would be returned to its county of origin through rebates, incentives, training and other Program initiatives.

Table 5 lists the results of the PY13 contributions to the PBF by island.

| Table 5 Contributions to PBF by Island | | | | |
|---|--------------------------------|-----------------------------|---------------------|----------------|
| Island | Residential Program Investment | Business Program Investment | PBFA Investment | % |
| Hawaii | \$3,061,860 | \$2,548,359 | \$5,610,219 | 12.9% |
| Lanai | \$60,177 | \$67,237 | \$127,414 | 0.3% |
| Maui | \$2,883,051 | \$2,670,209 | \$5,553,260 | 12.7% |
| Molokai | \$81,112 | \$72,062 | \$153,174 | 0.4% |
| Oahu | \$12,780,054 | \$19,424,182 | \$32,204,236 | 73.8% |
| Totals | \$18,866,254 | \$24,782,050 | \$43,648,303 | 100.00% |
| | | | | |
| County | Residential Program Investment | Business Program Investment | PBFA Investment | % |

» PERFORMANCE INDICATOR RESULTS

Performance Award for Achieving Targets

Under the PBFA Contract, Program Performance Awards are provided from a “performance pool” created through a holdback of \$55,708 from each monthly invoice (prior to tax) for Leidos work performed. A total of \$668,500 was withheld over the PY13, which equates to \$700,000 once tax is applied. Leidos, as the PBFA, has the ability to earn the \$700,000 by achieving 100% of the performance indicator targets, or a portion thereof based on the percentage of targets met. If the PBFA exceeds its targets, up to an additional \$133,000 could be awarded.

The maximum performance award potential for PY13 is \$833,000 as shown in **Table 6**.

| Table 6 Potential Performance Awards | | | | | |
|--|-------------------|--------------------|----------------------|--------|------------|
| Indicator | Minimum | Target | Maximum | Weight | Target |
| First Year Energy Reduction | 75% \$ 183,750 | 100% \$ 245,000 | 123.8% \$ 303,188 | 35% | \$ 245,000 |
| Peak Demand Reduction | 75% \$ 26,250 | 100% \$ 35,000 | 123.8% \$ 43,313 | 5% | \$ 35,000 |

» PERFORMANCE INDICATOR RESULTS

Performance Award Claim Summary

The Program's Performance Award Claim for PY13, is \$616,981.24 (including tax) or 88.4% of the Program's potential target performance awards.

The Program's Performance Award Claim Summary based on the Program's Net Savings Impacts (kWh, kW and TRB), Market Transformation and Island Equity results are contained in **Table 7**.

| Table 7 Performance Claim Summary | | | | |
|--|---------------|---------------|-------------|---------------------|
| Indicator | Target | Results | % of Target | Award Claim |
| First Year Energy Reduction (kWh) | 141,616,143 | 127,007,811 | 89.7% | \$219,727.17 |
| Peak Demand Reduction (kW) | 17,821 | 16,787 | 94.2% | \$32,968.34 |
| TRB NPV of Utility Cost Avoidance (\$) | \$177,013,974 | \$156,542,771 | 88.4% | \$247,618.73 |
| Market Transformation | | | | |
| Behavior Modification | 18,000 | 23,297 | 129.4% | \$23,334.00 |
| Professional Development | 1,000 | 1,336 | 133.6% | \$23,333.00 |
| Technical 'Know-How' | 2,000 | 223 | 11.2% | \$0.00 |
| Island Equity | | | | |
| Honolulu County | 73.8% | 71.7% | 97.2% | \$70,000.00 |
| Hawaii County | 12.9% | 13.2% | 102.6% | |
| Maui County | 13.4% | 15.1% | 112.8% | |
| Performance Award Claim | | | | \$616,981.24 |

Technical Know-How was a new target area for the Transformational Program in PY13. Given the Program's limited experience in this sector, the original target goals applied were not attainable within the existing market. The Program has taken these lessons learned into account for PY14 and modified the target goals accordingly.

The tables on the subsequent pages provide the detailed calculations for each metric following the guidelines in Attachment C in the PBFA Contract.

>> PERFORMANCE INDICATOR RESULTS

Cumulative Annual Electric Energy Savings (Program-Level) Award Claim: \$219,727.17

The Program Energy Reduction was 127,007,811 kWh, which was 90% of the target of 141,616,143 kWh in the award claim of \$219,727.17. This award is calculated from \$183,750 for meeting the minimum level and \$35,977.17 for the remaining savings of 20,795,704 kWh awarded at a rate of \$0.001730/kWh achieved beyond the minimum.

See calculations in **Table 8** for details.

BUDGET PROGRESSION & EXPENDITURES

PY13 Annual Plan Budget

Pursuant to the Program's approved PY13 Annual Plan, the Program's initial budget for the program year was \$33.4M, comprised of \$19.7M in Incentives, \$11.6M in Non-Incentives, and \$2.2M in Transformational Incentives. As detailed in **Table 13** approximately 45% of the budget was allocated to Residential Programs and 55% to Business Programs, consistent with the prior Program Year.

| Table 13 PY13 Annual Plan Budget | | | |
|--|-------------------|-------------------|-------------------|
| Activity | Non-Incentive | Incentive | Total |
| RESIDENTIAL PROGRAMS | | | |
| REEM | 2,591,084 | 7,504,500 | 10,095,584 |

Budget Reallocations

New to PY13 were changes in the Program’s process to request reallocation of funds. In PY13 the program was given discretion to reallocate funds within certain areas without a formal contractual request. Funds were allowed to be moved within each of the Operations & Management areas (Residential and Business) and within each of the Incentive areas (Residential and Business). As a result, there was only one official reallocation during PY13. There were, however, internal budget transfers. Specifics of the reallocation and internal transfers are detailed in **Table 14** and described below.

| Table 14 Budget Progression 7/1/13-6/30/14 | | | | | | | | | | | | |

¹ This line is updated in R1 to reflect the amount of Performance Incentives excluding taxes, consistent with how Performance Incentives are withheld in the monthly invoices.

² These differences correspond to the change per Footnote 1, net of the resulting (69,000) change in the "Total Tax on Non-Incentive Without PI" line item.

» PORTFOLIO FIFTH YEAR IMPACTS

Reallocation (R1)

The PY13 reallocation effective January 2014 was to update the budget such that Incentives comprised 70 percent of the program year budget and Non-Incentives comprised 30 percent (i.e., a “70/30 split”). In addition, a tax adjustment was made to the “Performance Incentives (Prior to Tax)” line item. The detailed changes were as follows:

- Transferred \$1,533,335 (inclusive of taxes) from Residential and Business Operations Non-Incentives to Residential and Business Program Incentives.
- The “Performance Incentives (Prior to Tax)” line item was adjusted to reflect the amount of Performance Incentives (PI) excluding taxes, or \$668,500. Historically, this line has reflected \$700,000, representing total PI including taxes. However, PI withholding on monthly invoicing has been prior to taxes, and thus this change more accurately reflected this line item as well as taxes captured in other Non-Incentive line items.

Internal Budget Transfers

During the course of PY13, there were five internal budget transfers to meet changing operational needs. The transfers were as follows:

- **November 2013** – Transferred \$1M of Incentive funds from BESM to CBEEM.
- **April 2014** – Transferred \$200K of Business O&M funds from BEEM and \$50K from Business Outreach to CBEEM.
- **June 2014** (Reflected in May Monthly Report) - Transferred Business O&M funds as follows: \$80K from Business Evaluation to BEEM (\$40K) and CBEEM (\$40K).
- **June 2014** (Reflected in May Monthly Report) - Transferred Incentive funds as follows: \$100K from RESM and \$120K from RHTR to REEM; \$475K from BESM to CBEEM and \$400K from BHTR to BEEM.
- **August 2014** – Various O&M funds transfers. Residential transfers as follows: FROM - CESH (\$12K), RESM (\$27K), RHTR (\$60K), and Residential Evaluation (\$110K); TO - REEM \$205K and Residential Outreach \$4K. Business transfers as follows: FROM - BESM (\$30K), BHTR (\$31.5K), and Business Evaluation (6K); TO - BEEM 18K, CBEEM 41.5K, Business Outreach 8K.

» PORTFOLIO FIFTH YEAR IMPACTS

Portfolio Expenditures

Throughout the year, the Program was diligent in reviewing operational needs and leveraging funding to drive program value. At year-end, the Program had utilized 97% of budgeted Incentives, 99% of budgeted O&M (including holdback amounts) and 99% of budgeted Transformational Incentives. Details of final PY13 expenditures and unspent funds by program categories are shown in **Table 15**. Specific discussions related to each Residential and Business program are provided within those respective sections.

On-Bill Financing Program

In PY13, the Program contract was amended to include funding for the On-Bill Financing (OBF) Program. The OBF budget and deliverables were described in the OBF proposal attached to Supplemental Contract #5 (as revised on May 31, 2013). OBF budget and PY13 expenditures are detailed in **Table 16**. Although numerous OBF deliverables were developed in PY13, delays outside of Program control resulted in program launch being pushed back to late 2014. As a result, at year-end, the OBF Program had utilized 39% of its allotted funds. A more detailed discussion on the OBF program can be found in the Program Overview.

>> PORTFOLIO FIFTH YEAR IMPACTS

Introduction

There are three levels of energy and demand savings shown in this Report. The three levels are used to show how energy and demand savings are credited at the customer's meter (Customer Level Savings), at the utility system generation level (System Level Savings) and at the PBFA Contract level (Program Level Savings).

1. **Customer Level Savings (Gross at Meter)** – This savings figure is the gross change in energy consumption at the customer meter that results directly from Program-promoted actions taken by Program participants. The savings are determined by direct metering, engineering calculations, or measurement and verification of prior installations of the particular savings measure. This is the savings level defined in the Program's Technical Resource Manual (TRM).
2. **System Level Savings (Gross Generated)** – This savings figure is realized at the utility system level and includes the transmission, distribution and generation station energy losses between the end-use customer and the utility generating units. System Level Savings has been termed Gross Level Savings in previous reports.
3. **Program Level Savings (Net Generated)** – This savings figure shows the amount of energy reductions determined to be directly attributed to PBFA Program actions by separating out the impacts that are a result of other influences, such as consumer self-motivation or free-riders. Free-riders are ratepayers or participants who received an incentive and/or education from the Program, but the incentive and/or education did not play a role in their decision to purchase the savings measure. These ratepayers would have taken action or purchased the energy-efficient item regardless of the incentive and therefore, Program Level Savings removes their participation.

PORTFOLIO FIFTH YEAR IMPACTS

Portfolio Energy and Demand Savings

Program Energy Savings for PY13 were:

- **First Year** – 127,007,831 kWh
(56.1% in Residential and 43.9% in Business programs)
- **Lifetime** – 1,367,592,053 kWh
(40.6% in Residential and 59.4% for Business programs)

The difference in percentage contributions between first year and lifetime savings remains due to the relative weight of CFLs and the Peer Group Comparison in the residential portfolio. These measures have relatively short measure lives (6 years and 1 year, respectively) as compared to longer lived measures in the business portfolio this year, bolstered by the LEDs having 15 year measure lives. Residential measures have an average measure life of 7.8 years in PY13 up from 7.0 years in PY12, while business measures have an average measure life of 14.6 years in PY13 up from 13.5 years in PY12.

Program Peak Demand reduction for PY13 was:

- Peak Demand – 16,786 kW (56.5% from Residential and 43.5% from Business)

The following tables provide a summary of the Residential and Business programs in the context of their level of activity, incentives, energy-saving impacts and cost effectiveness at the Program, System and Customer levels.

- **Table 17:** Cumulative Annual Electric Energy Savings (Program Level) by Budget Category
- **Table 18:** Cumulative Annual Electric Energy Savings (System Level) by Budget Category
- **Table 19:** Cumulative Annual Electric Energy Savings (Customer Level) by Budget Category

See Attachment H for a chart comparing the Program's kWh benefits and cost effectiveness at the Program, Customer and System levels.

PORTFOLIO FIFTH YEAR IMPACTS

Savings at Customer and Program Levels

Program Level Savings translate from Program participants (customers) achieving first-year savings based upon the energy efficiency measures they purchased or otherwise installed.

First-year Customer Energy Savings was 146,232,261 kWh per year (1.6% of 2013 utility sales), while Customer Peak Demand Savings was 19,466 kW (1.3% of 2013 utility sales). This does not reflect Peak Demand Savings for the customer as it may not coincide with their actual measured peak demand used for billing purposes. The utility reported non-coincident peak demand across all islands of 1,535,000 kW.

The following tables provide summaries of cumulative energy savings and peak demand savings in the context of program budget categories and island, specifically:

- **Table 20:** Energy (kWh) Reduction by Impact Level and by Island
- **Table 21:** Demand (kW) Reduction by Impact Level and by Island
- **Table 22:** Energy (kWh) Reduction by Impact Level and by Program
- **Table 23:** Demand (kW) Reduction by Impact Level and by Program

PORTFOLIO FIFTH YEAR IMPACTS

CFLs & LEDs – Market Shift Continues Toward LEDs

The Program reduced its dependency on CFLs in PY13. There were 1,501,579 Residential and Business CFLs incentivized, this is 15.4% reduction from the 1,775,226 CFLs in PY12. CFL and LED savings remain a significant contributing measure to the Program as shown in **Table 24**.

The combined Residential and Business CFL and LED impact was a lower percentage of the portfolio, now 52% of the energy reduction achieved and 55% of the demand.

PORTFOLIO FIFTH YEAR IMPACTS

CFL counts dropped by 15.4% compared to PY12 participation numbers whereas LEDs have increased 191%. LEDs will continue to increase their role in the Program-achieved savings. See **Table 25** for details.

| Table 25 | | | |

| Average kWh Savings Per Lamp | | | |
| Program Year | Business | Residential | Total |
| PY2009 | 53 | 52 | 52 |
| PY2010 | 83 | 26 | 28 |
| PY2011 | 159 | 29 | 35 |
| PY2012 | 150 | 29 | 30 |
| PY2013 | 114 | 32 | 32 |

In PY13, the average kWh savings per lamp reflects an updated Net-To-Gross value implemented based on feedback from the Evaluation Measurement & Verification (EM&V) team.

PORTFOLIO FIFTH YEAR IMPACTS

Measure Contribution toward Savings Impacts

In PY13, the Program incentivized over 68 measures in 19 different measure categories. High Efficiency Lighting and High Efficiency HVAC accounted for the greatest savings impact and High Efficiency Water Heating was the third most impactful measure category. **Table 26** provides a summary of all measure categories and their respective energy impact for PY13.

- #1 Contributor - High Efficiency Lighting** – 65% first year (down from 67% in PY12) and 56% lifetime energy savings (up from 50% in PY12). CFLs, LEDs and then T8LW lighting contributed the most toward the Program as they are the most cost-effective measures a customer can implement. LEDs have increased to the second single measure contributor at 17,640,677 kWh/year behind CFLs at 47,940,126 kWh/year.
- #2 Contributor - High Efficiency HVAC** - 11% first year and 16% lifetime energy savings. Customized Chiller Plant and Prescriptive Chillers contributed 72% of this category.
- #3 Contributor – High Efficiency Water Heating Measures** - 4% first year (steady from 4% in PY12) and 5% lifetime energy savings (down from 6% in PY12).

| Rank | Category | Apps | % | Measure Quantity | Program Demand (kW) | % | Program Energy (kWh 1st Year) | % | Program Energy (kWh - Life) | % | Incentives | % | Lifetime Cost (\$/kWh) |

PORTFOLIO FIFTH YEAR IMPACTS

Energy Impacts by Rate Schedule

Program Level impacts (first year) were greatest in the Residential Rate Schedule “R” with 68,852,918 kWh or 54.2% of savings, of which 72% was realized on Oahu. The Oahu Residential rate class provided the greatest savings of 50,102,519 kWh per year of all the rate schedules (39% of PY13 total kWh). A summary of Program energy impacts by rate schedule is provided in **Table 27**.

| Table 27 | | | | | | | | |
|---|-------------------|------------------|-------------------|-------------------|------------------|----------------|--------------------|---------------|

Energy Efficiency Portfolio Standard (EEPS) Impacts

2014 Energy Efficiency Potential Study

The PUC contracted with EnerNOC Utility Solutions Consulting to conduct an independent evaluation of energy efficiency (EE) market potential in the State of Hawaii from 2013-2030. This study identifies the potential energy savings that can be achieved by contributing entities toward the goals outlined in the EEPS.

The Executive Summary of the report can be found at:

http://puc.hawaii.gov/reports/energy-reports/attachment/state_of_hi_potential_study_final/

The following are the key findings and figure excerpted from the report.

Key Findings

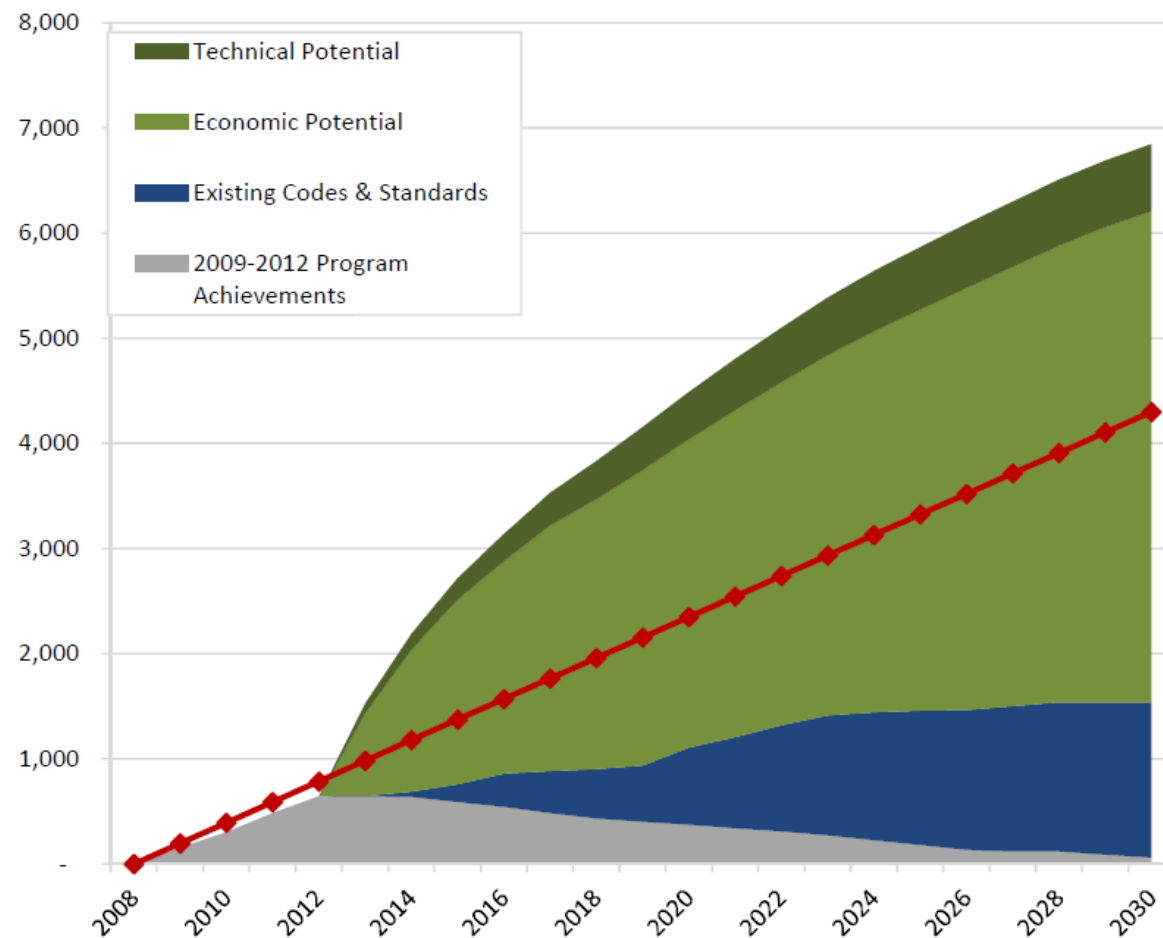

The purpose of the study was to assess whether the State is on track to meet the EEPS goals by 2030. As shown in Figure ES-1, this study concludes it is **highly** likely that the **EEPS** goals can be met through a combination of interventions:

- **Energy-efficiency programs** like those being delivered by Hawai'i Energy [the Public Benefits Fee Administrator (PBFA)]¹ and Kauai Island Utility Cooperative (KIUC)
- **Existing appliance standards and building codes** that are already in place or "on the books" for the next five years. Federal, state and local codes and standards taking effect on or after January 1, 2009 count toward EEPS goals. Savings from these existing codes and standards are substantial and reflect the federal Energy Independence and Security Act of 2007 (EISA) lighting standard and several federal appliance standards that were established since the EEPS goal was set in 2008.
- **Economic potential** is the amount of cost-effective potential remaining after appliance standards and building codes are taken into consideration. In addition to savings that can be gained through future EE programs, economic potential also includes savings that result from changes in manufacturing practices as a result of agreements with ENERGY STAR or energy efficiency agencies (most notable for consumer electronics) and savings from early adopters that purchase energy-efficient appliances or equipment **outside** of programs. While these latter two categories, (savings from manufacturing practices and from early adopters) are not directly attributed to energy efficiency programs offered by KIUC or the PBFA, the savings are significant. If a method can be developed to measure the savings from these categories in the future, it might be appropriate to count these savings toward the EEPS goal.

» PORTFOLIO FIFTH YEAR IMPACTS

Figure ES-1 shows the year-by-year potential savings from the interventions against the EEPS goal. This study was grounded in 2012 and estimates potential savings for 2013 through 2030. For 2009–2012, program savings estimates developed outside this study were used and are assumed to decay over time. The study estimates that cost-effective cumulative energy efficiency potential in 2030 is 6,210 GWh, or about 144% of current EEPS goals. This indicates that the while the EEPS goals are aggressive, it is likely they can be met cost-effectively.

Figure ES-1 *Potential Savings Estimates Compared to the EEPS Goal (GWh)*

» PORTFOLIO FIFTH YEAR IMPACTS

Application of Fifth Year Energy Savings towards EEPS Goal

The targeted goal of the EEPS is a 4,300 GWh reduction from the expected usage in 2030. This “slice of savings” will be the result of many actions, including energy efficiency retrofits, increased appliance standards, product improvements (to meet consumer demands for longer battery lives and less environmental impact), building codes, behavior change and much more. Hawaii Energy will capture many of these actions through our programs and services.

As measures and actions are put into place, each will start to provide an annual energy savings. These savings will be provided each year until the device or action is replaced with a new one that provides at least the same energy reduction that will maintain the savings. For simplicity this year, we have decided to show the savings as forever persistent and assume first year savings will last forever.

Figure 5 projects the results of the current program performance level impacts being achieved each year. Hawaii DSM program operations began in 1996; however, **Figure 5** depicts the yearly DSM performance from 2008 - 2013 and adds the current PY13 impacts as if they will be achieved each year into the future. The result is that 3,476 GWh, or 80% of the goal is potentially achieved (purple line).

The difference between actual electricity sales (green line) and the Program’s cumulative impact (light blue line) has increased to nearly 1,000 GWhs since the inception of DSM programs (blue area).

The sales of energy on each island are also provided for scale and reduction opportunity identification. The last piece of information added this year is a demonstration of the estimated annual energy consumption of 100,000 electric vehicles (based on 2013 technology, energy use of 8 kWh/day).

PORTFOLIO FIFTH YEAR IMPACTS

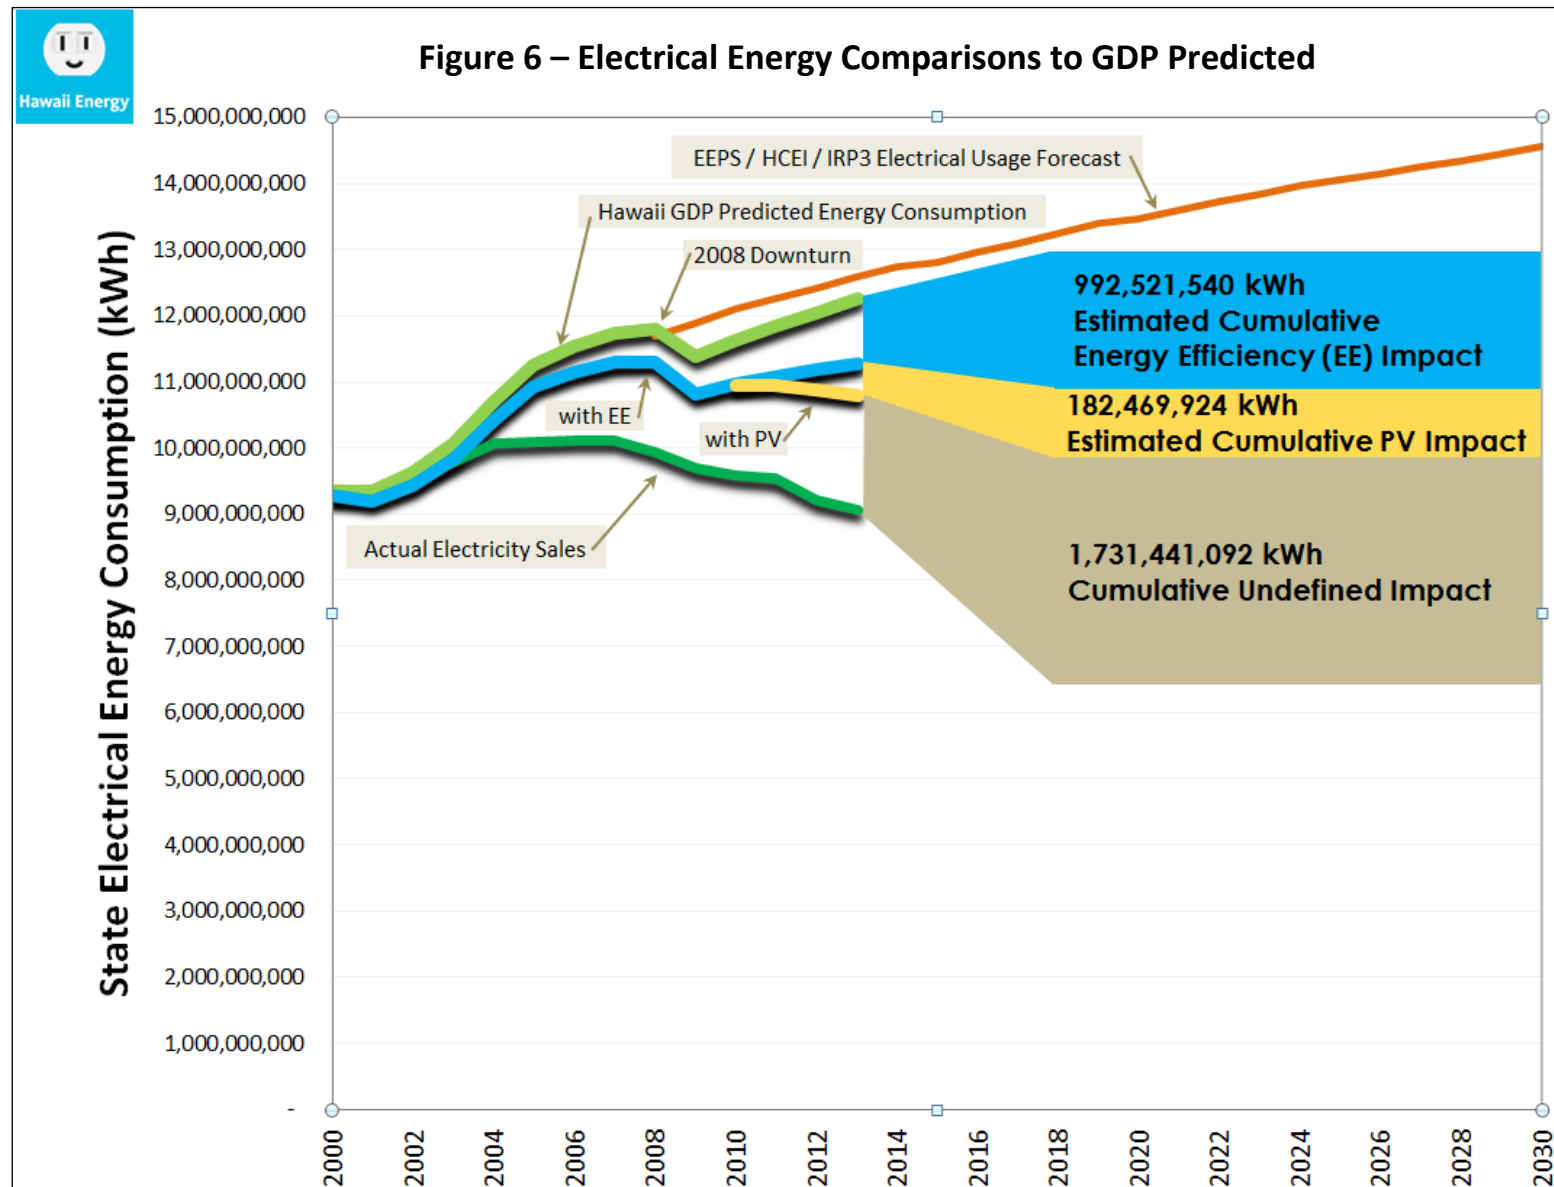

» PORTFOLIO FIFTH YEAR IMPACTS

Cumulative Impacts of Energy Efficiency (EE) and Non-Utility Photo-Voltaic (PV) Installations

Figure 6 shows Hawaii GDP economic activity, cumulative impact of the actions and measures supported by DSM programs, and estimated roof top PV contribution, visualized as light green, light blue, and yellow lines respectively. The light blue line is calculated by adding the cumulative energy savings for each year of EE activity to the Hawaii GDP predicted energy consumption. Similarly, PV cumulative impact is also added to show it has made significant increases over the past four years, providing a Hawaii Energy-estimated 182 GWh reduction in electrical energy sales. The remaining undefined impacts are predictably market-driven. The Program will investigate these reductions in PY14 utilizing the PUC 2014 Energy Efficiency Potential Study and Program-purchased benchmarking data. Areas of review will include appliance and device sales, energy code compliance, customer-driven efficiency and other consumer actions.

It can also be seen that electrical sales (dark green line) flatlined from around 2004 until the 2008 economic downturn, when sales actually started to decline. Much of the 2004 to 2008 stagnation may be attributed to improved consumer and business electronics (e.g. the transition from cathode ray tube (CRT) screens to flat panel displays), as well as rapid adoption of improved consumer appliances, high efficiency lighting (CFLs and T8). Although the GDP has since recovered to pre-2008 levels, expected energy sales have continued to decrease, which may be attributed to: 1) the dramatic improvements in air conditioning technologies (e.g. inverter-driven variable capacity and oil-free compressor units) and 2) the maturation and cost-effectiveness of LED technology.

PORTFOLIO FIFTH YEAR IMPACTS

Portfolio Impacts Relative to Load

Tables 33, 33a and 34 show the Program and Customer Level Impacts as compared to PY13 electricity sales.

Customer level savings were equivalent to 1.6% of the 2013 annual energy usage and 1.3% of the peak demand for the utility customers.

Oahu had both the largest energy and demand reductions and the largest percentage of load with energy at 1.6% and demand at 1.3%.

| Table 33 Energy Impacts vs. Sales | | | | | |

PORTFOLIO FIFTH YEAR IMPACTS

Portfolio Total Resource Benefit (TRB) and Total Resource Cost (TRC)

TRB

The utilities' total avoided cost of all saved energy and capacity avoided is called the Total Resource Benefit (TRB). The total Program portfolio had a net TRB of \$156,542,771. Table 38 shows the measures and their relative contributions. The top three measures provided 78% of the TRB value. They are: High Efficiency Lighting, High Efficiency HVAC and High Efficiency Water Heating.

- *High Efficiency Lighting* – The largest contributor to the TRB at \$92,922,942 (59.4%). CFLs alone had a 38% first year energy impact contribution to the Program, despite a short six (6) year useful life and low unit savings number. CFLs were the greatest contributor to the TRB at \$38,451,943 (24.6%).
- *High Efficiency HVAC* – The second measure to offer significant contribution at \$24,520,860 (15.7%) was High Efficiency HVAC.
- *High Efficiency Water Heating* – The third largest measure contributing to the TRB at \$9,836,876 (6.3%) was High Efficiency Water Heating.

TRC

Total Resource Cost is the customer's project or incremental cost to purchase and install the energy-efficient equipment or make operational changes above what would have been done anyway. PY13 Program Savings were achieved with an estimated TRC of \$114,298,416, compared to \$56,213,606 in PY12.

The largest customer investments were High Efficiency Air Conditioning at \$22,966,459 (20.1%), followed by LEDs at \$20,145,278 (17.6%) and Solar Water Heaters at \$20,145,278 (31.3%). See **Table 35** for details.

PORTFOLIO FIFTH YEAR IMPACTS

TRC Test

The societal cost test of the TRB/TRC provides a metric of how much “return on investment” is provided by:

- Saving energy versus creating it (kWh reductions)
- Avoiding the need for increased power plant capacity (Peak kW reductions)

The TRB/TRC ratio of 1.4 indicates that society is getting a 1.4 times return (or 140%) on their investment. Currently this does not include the benefits of avoided transmission and distribution costs or any “externalities” that bring benefit to society, such as reductions in air and water emissions. Refer to **Tables 36-37** for details under TRB/TRC.

| Table 36 TRC Measure Values | | | | | | | | | | | | | | |

PORTFOLIO FIFTH YEAR IMPACTS

Island Equity

The Island Equity target is based on incentive dollars spent as compared to the contribution of each County towards the Public Benefits fund. In PY13, the Program invested in both Hawaii and Maui counties in two direct install programs:

- Hard-to-Reach Residential Solar Water Heating, a partnership with the Hawaii Community Economic Opportunity Council (HCEOC) and Maui Economic Opportunity (MEO).
- Direct Installation Lighting Program in small businesses and restaurants.
- The impact of the actual incentive distributed within each County are as follows:
- PY11 = 66% of incentive funds in Honolulu, 16% in Hawaii and 18% in Maui counties.
- PY12 = 64% of incentive funds in Honolulu, 23% in Hawaii and 13% in Maui counties.
- PY13 = 74% of incentive funds in Honolulu, 14% in Hawaii and 13% in Maui counties as shown in **Table 38**.

*Reference **Table 1** - PY13 Customer Energy Cost Savings (page 13)

>> BUSINESS PROGRAM

Impacts

For PY13, Hawaii Energy's Business program achieved savings of 55,765,938 kWh (first year) and 7,294 kW savings with \$11,194,615 in incentives. In relative terms, 54.8% of Hawaii Energy's incentives captured 43.9% of kWh (first year) and 43.5% of kW demand first year savings, respectively, with a Total Resource Benefit to Cost ratio of 1.3.

Table 42 provides a detailed breakdown by program with a closer look at each program to follow. For PY13, Hawaii Energy's Business program realized results by continuing to offer programs, services, measures and related incentives to address opportunities in the marketplace and accelerate the adoption of energy-efficient technologies.

| Table 42 Business Program Impacts Summary | | | | | | | | | | | | | | | |
|--|----------------|---------------------|---------------|-----------------------------|---------------|-----------------------------|---------------|------------------------------|------------|------------------------------|---------------|---------------------------|---------------|---------------------|---------------|
| Category | Units | Program Demand (kW) | % | Program Energy (kWh 1st Yr) | % | Program Energy (kWh - Life) | % | Average Measure Life (Years) | TRB/ TRC | Total Resource Benefit (TRB) | % | Total Resource Cost (TRC) | % | Incentives | % |
| BEEM | 118,085 | 3,868 | 53.0% | 26,941,496 | 48.3% | 382,247,212 | 47.1% | 14.2 | 1.1 | \$43,581,303 | 49.6% | \$41,347,861 | 61.2% | \$4,872,146 | 43.5% |
| CBEEM | 310 | 2,799 | 38.4% | 22,539,657 | 40.4% | 338,108,258 | 41.7% | 15 | 1.5 | \$34,914,212 | 39.7% | \$23,355,756 | 34.6% | \$4,025,953 | 36.0% |
| BESM | 16,878 | 287 | 3.9% | 3,872,686 | 6.9% | 57,650,739 | 7.1% | 14.9 | 2.5 | \$5,549,055 | 6.3% | \$2,180,652 | 3.2% | \$1,596,568 | 14.3% |
| BHTR | 11,371 | 340 | 4.7% | 2,412,099 | 4.3% | 33,769,391 | 4.2% | 14 | 5.5 | \$3,881,091 | 4.4% | \$701,956 | 1.0% | \$699,920 | 6.3% |
| Total | 146,644 | 7,294 | 100.0% | 55,765,938 | 100.0% | 811,775,599 | 100.0% | 14.6 | 1.3 | \$87,925,661 | 100.0% | \$67,586,224 | 100.0% | \$11,194,615 | 100.0% |

A number of the Program's offers are highlighted below as examples of driving energy efficiency projects through productive collaboration with customers, manufacturers, facility management firms, consultants and contractors that produced impressive results.

Central Plant Optimization Program

This complex offer was phased out in PY12 due to poor cost effectiveness, complexities of installation and mixed energy savings results. In PY13 we completed the evaluation phase of the three projects that were completed under this offer. The Queens Medical Center project produced an annual savings of 687,013 kWh and 112.2 kW. The property at 677 Ala Moana produced an annual savings of 224,717 kWh and 65 kW. Hale Pau Hana is an AOA on Maui. We executed a variant of the central plant optimization on their solar thermal hot water system. The project produced an annual savings of 27,820 kWh and 0 kW due to peak period hot water requirements.

>> BUSINESS PROGRAM

Condominium Submetering

Requiring significant effort by Program Specialists to assist condominium boards and condominium and apartment residents to save energy, the continuation of this program in PY13 saw eleven additional successful installations of submetering at major condominium or apartment complexes. In total, Hawaii Energy paid out \$354,600 in incentives for the installation of submeters on 2,364 individual units. These facilities are expected to save more than 181 kW in demand reductions and approximately 1.4 million kWh in annual tenant energy usage.

Central Chiller Plant Benchmarking Program

The Central Plant Benchmarking Program was continued in PY13. The intent of the program is to incentivize certain large local facility operators to install the metering necessary to monitor performance of their chilled water plants. With accurate, real-time operational and efficiency information, building engineers and managers are able to make smarter decisions related to operations, maintenance and capital investment in their facility. For example, a large resort on Hawaii Island installed benchmark metering and was able to determine that their newly-purchased chiller was not performing as efficiently as expected. As a result, they are collaborating with the chiller contractor and Hawaii Energy to resolve the problem. For engineers at Hawaii Energy, having access to real-time and trend data for a variety of applications is an invaluable resource.

Small Business Direct Install Lighting (SBDIL)

This offer provided full-cost lighting retrofits to 449 small businesses and restaurants to achieve 69,106,803 kWh - Life in customer level savings. The \$1,903,806 of PBFA funds invested into these projects are now producing over \$2,202,612 in annual savings for these businesses. This is a 116% annual Internal Rate of Return (IRR) and will achieve over \$30.8 M in lifetime cost savings. In PY13 the cost effectiveness of this program increased significantly due to the elimination of the T8 to low-wattage T8 retrofits and concentration on T12 to T8 conversions.

» BUSINESS PROGRAM

Expenditures

The Hawaii Energy commercial team continued its focus beyond the BEEM and CBEEM Program in PY13, with the hard-to-reach sector (BHTR) and Business Energy Service and Maintenance (BESM).

See **Table 43** for the detailed expenditures.

| Table 43 Business Program Expenditures | | | | | |

» BUSINESS PROGRAM

Business Trade Allies

Background

Trade allies include product manufacturers, wholesale and retail suppliers, equipment contractors, architects, engineers and electricians. These individuals and companies are those on the front lines directly responsible for energy efficiency measures being sold, designed, financed, installed, commissioned and maintained. By working with them, the Program is successful in uncovering opportunities for partnerships with trade allies that leverage resources to promote energy conservation and efficiency.

Trade Ally Program Feedback

Hawaii Energy incorporates trade ally perspectives and concerns in the program planning process to establish well-supported, effective strategies. Developing a successful relationship with these industry leaders attracts other groups over time. Industry groups are one way Hawaii Energy incorporates the views of representatives of key trade groups. By sharing insights and experiences on different technology and equipment performance with the trade allies, the Program's knowledge and awareness of different market segments are enhanced, thus helping to influence customer's energy-saving decisions. See **Table 44** for details.

Ongoing Training

To be on the cutting edge of the conservation and efficiency field, Hawaii Energy provides ongoing training and support for the trade allies. Hawaii Energy has developed a strong training program for lighting and HVAC contractors, mechanical contractors, architects and engineers participating in its business incentive program. Educational and promotional workshops are conducted to influence commercial purchase decisions.

In PY13, Hawaii Energy successfully launched its water cooler timer offer for businesses. Free timers were provided to businesses and installed directly by the water cooler timer vendor and water delivery companies. 500 timers were distributed to the Navy and 3,000 were distributed and installed at local businesses through property management companies. This offer provided energy savings of 202.5 kWh/year per timer with a cost effectiveness of \$.074/kWh. Due to the success of this offer, the program has decided to expand this offer to our residential market in PY14.

Table 44
Business Project Sources

| Trade Allies | Measures | Customer Level Demand Savings (kW) | Customer Level Energy Savings (kWh 1 st Yr) | Customer Level Energy Savings (kWh - Life) | Cumulative Customer Level Energy Savings | Incentives |

» BUSINESS PROGRAM

Business Energy Efficiency Measures (BEEM) Program

Objective

The objective of this program is to acquire electric energy and demand savings through customer installations of standard, known energy efficiency technologies by applying prescriptive incentives in a streamlined application process. Measures incentivized through BEEM include:

- High Efficiency Lighting
- High Efficiency HVAC such as water-cooled chiller, variable refrigerant flows (VRF) and packaged & split systems
- CEE Premium Efficiency Motors
- High Efficiency Water Heating
- Variable Frequency Drives (VFDs) connecting to pool pumps, chilled water pumps, condenser water pumps and air handling units
- Window Tinting
- Cool Roof Technology
- ENERGY STAR® Refrigerator

The Courtyard Marriott Waikiki Beach received an incentive check of \$119,385 for the completion of several energy-saving installations to reduce their hotel's electricity usage. They installed split air-conditioning systems, a variable frequency drive for the pool pump, LED lamps in guest corridors and air-conditioning energy management control systems in their 400 guestrooms. Through these efforts, the hotel is estimated to save approximately \$190,000 in electricity costs or 625,000 kWh per year.

» BUSINESS PROGRAM

Accomplishments

ENERGY STAR® LED Lamps

Advancement in the number of LED products available and listed by ENERGY STAR® and an adjustment to the program this year to allow other listings such as DesignLights Consortium® and Lighting Facts® lead to another increase in the number of LED lamps installed in Program Year 2013. This LED offering achieved energy savings of 6,368,728 kWh this past year or 23.6% of the total BEEM program energy savings. In addition to increasing the usage of LEDs, the offering encouraged customers to upgrade their lighting controls by providing higher incentives for dimmable LED lamps. With dimmable LED lamps customers can achieve even more energy savings.

Condominium Submetering

The offering was designed to ensure fairness when allocating energy costs among dwellings, as well as to encourage energy conservation through direct feedback and financial responsibility for personal energy use. For AOAOs, submetering presented a great opportunity to eliminate their largest variable cost: energy. This program was initially developed in PY10 and has gained significant momentum since the first projects were completed in PY11. In total, 2,364 submeters were installed on individual apartments and condominium units in PY13 resulting in 1,407,274 kWh first year energy savings. This was an increase in savings from this measure by more than ten times over the previous year.

Impacts

For PY13, the BEEM Program achieved savings of 26,941,496 kWh (first year) and 3,868 kW savings with \$4,872,145.62 in incentives. In relative terms, 23.9% of Hawaii Energy's incentives captured 21.2% kWh (first year) and 23.0% kW of the demand first year savings for PY13. **Table 45** provides further details.

- **# 1 Contributor to BEEM – LED Lamps (23.6%)**

LED lamps were the largest contributor to the BEEM Program savings with energy (first year) and demand savings of 6,368,728 kWh and 885 kW, respectively.

- **# 2 Contributor to BEEM – T12 to T8 Lighting (14.8%)**

T12 to T8 low wattage lighting was the second largest contributor to the BEEM Program savings with energy (first year) and demand savings of 3,988,380 kWh and 532 kW, respectively.

Ilikai Apartment Building received an incentive check of \$153,000 for the installation of a submetering system for their building. They are estimated to save approximately \$270,000 and 995,000 kWh per year. Submetering raises awareness, reduces energy use and can help save money on electric bills. By fairly allocating the cost of electricity used, it encourages occupants to conserve energy in each of their units.

>> BUSINESS PROGRAM

Expenditures

The Program distributed nearly all BEEM operation and incentive budgets due to the popularity and demand for the program’s offerings. See **Table 46** for details.

| Table 46 BEEM Program Expenditures | | | | | |
|---|-----------------------|-----------------------|---------------|--------------------|-----------------|
| | Expenditures | R1 Budget | Percent Spent | Unspent | Percent Unspent |
| BEEM Operations | \$1,012,647.67 | \$1,013,152.00 | 99.95% | \$504.33 | 0.05% |
| BEEM Incentives | \$4,872,145.62 | \$4,920,800.00 | 99.01% | \$48,654.38 | 0.99% |
| Total BEEM | \$5,884,793.29 | \$5,933,952.00 | 99.17% | \$49,158.71 | 0.83% |

Ko'olaa'ula is a low income housing development located in Ewa Beach, Oahu accommodating larger, multi-generational families. They made many energy-saving upgrades including installing exterior lighting, adding occupancy sensors and installing ENERGY STAR® refrigerators and ceiling fans in the units. The property is expected to save an estimated 195,776 kWh each year and received a \$34,955 incentive, which helped them to fund additional improvements including in the community playground for children.

» BUSINESS PROGRAM

Customized Business Energy Efficiency Measures (CBEEM) Program

Objective

The objective of this program is to provide a custom application and approval process for participants to receive incentives for installing non-standard energy efficiency technologies. The commercial and industrial custom incentives enable customers to invest in energy efficiency opportunities related to manufacturing processes and other technology measures that may require calculations of energy savings on a case-by-case basis for specific, unique applications.

Custom incentives are available for all energy-savings opportunities that are not already covered by the prescribed incentives and are not limited to a certain list of measures. Some examples of custom technologies include, but are not limited to, energy management systems, exhaust ventilation control systems, high performance lighting, low emissivity glass and HVAC controls.

Accomplishments

ENERGY STAR® LED Fixtures

In PY13 both the quality and availability of LED products continued to increase, leading to more products being listed by ENERGY STAR®. In addition, the program began accepting listings from other rating agencies as certification of quality and eligibility for inclusion in the program. By accepting product listing by other rating agencies like DesignLights Consortium® and Lighting Facts® greatly increased to number and types of LED fixtures that could be installing in the CBEEM program. This led to a significant increase in savings in the program from LED fixtures.

Commercial Lighting

In addition to LED lighting fixtures, the CBEEM program was also successful in promoting innovative commercial lighting projects like bi-level fluorescent lighting for stairwell and hallways. Typically these areas, for safety reasons, have been illuminated with fluorescent fixtures that were on at full power 24 hours per day, 365 days per year. Today with occupancy controls and bi-level fixtures, these lamps can be powered at levels around 20% when not occupied, still providing some lighting for the area, and powered on at full power when any occupancy is detected. Studies have found that typical stairwells in apartment complexes are occupied less than 10% of the time, thereby generating significant saving in the non-occupied times.

Aloha Petroleum, the largest independent gasoline marketer in Hawaii, received an incentive check for \$41,352 for the installation of energy-efficient LEDs at 17 gas stations on Oahu. The new lights provide a warmer ambience and help increase visibility while customers pump their gas. They are expected to save an estimated 292,437 kWh annually; equivalent to saving \$88,290 in electricity costs.

» BUSINESS PROGRAM

Impacts

For PY13, the CBEEM Program achieved savings of 22,539,657 kWh (first year) and 2,799 kW savings with \$4,025,953 in incentives. In relative terms, 19.7% of Hawaii Energy's incentives captured 16.7% kWh (first year) and 17.7 % kW of the demand first year savings for PY12. **Table 47** provides a detailed breakout of the program.

- **#1 Contributor to CBEEM – Commercial Lighting (24.7%)**

Commercial Lighting was the largest contributor to CBEEM Program savings with energy (first year) and demand savings of 5,566,295 kWh and 648 kW, respectively.

- **#2 Contributor to CBEEM – LED Lighting (23.6%)**

LED technologies were the second largest contributor to CBEEM Program savings with energy (first year) and demand savings of 5,310,645 kWh and 799 kW, respectively.

Chaminade University currently serves over 2,800 students throughout a 65-acre campus, which is shared with St. Louis School and the Marianist Center of Hawaii. The university is working in phases to complete an energy-efficient retrofit on all of their exterior lighting, but recently replaced 77 old, inefficient lamps with new LEDs. With their exterior lighting on 12 hours a day, every day, this retrofit reduced their lighting usage by 73% and is estimated to save them \$6,380 per year. For this project, Chaminade received a \$3,170 incentive from Hawaii Energy.

» BUSINESS PROGRAM

Expenditures

The Program distributed nearly all CBEEM operation and incentive budgets due to the popularity and demand for the Program offerings, in particular the growth in LED lighting solutions. See **Table 48** for details.

| Table 48 CBEEM Program Expenditures | | | | | |
|--|---------------------|---------------------|---------------|------------------|-----------------|
| | Expenditures | R1 Budget | Percent Spent | Unspent | Percent Unspent |
| CBEEM Operations | 1,073,736.77 | 1,074,098.00 | 99.97% | 361.23 | 0.03% |
| CBEEM Incentives | 4,025,952.57 | 4,048,026.00 | 99.45% | 22,073.43 | 0.55% |
| Total CBEEM | 5,099,689.34 | 5,122,124.00 | 99.56% | 22,434.66 | 0.44% |

Located in Kapolei, Pacific Allied Products is a plastics manufacturing company that took steps to become more energy-efficient. Through the installation of a new high-speed bottle blower, they received a \$91,484 incentive check and they are estimated to save more than \$148,000 in electricity costs or 601,560 kWh annually. The bottle blower inflates plastic bottles by capturing and recycling excess air which then helps to save electricity. For example, the amount of electricity required to produce 1,000 half-liter bottles of water can be reduced by 43%.

» BUSINESS PROGRAM

Business Energy Service and Maintenance (BESM) Program

Objective

The objective of this program was to help target sectors that are currently underserved such as retail and small businesses. Additionally, this program conducted a more aggressive outreach effort to lighting and electrical contractors by offering training, education, promotional materials and frequent communications on program updates.

Accomplishments

Small Business Direct Install Lighting (SBDIL)

This offering targeted small businesses that have limited time and expertise to research lighting technology options, secure financing and hire contractors to replace their older, less efficient lighting technologies. This offering provided full energy-efficient lighting retrofits to small businesses in Hawaii, Honolulu and Maui counties. Small business customers that were either (1) a Schedule “G” rate class or (2) under master-metered accounts were eligible for this offer.

In the SBDIL program, Trade Allies recruited small businesses to participate, performed audits and executed the retrofits. This direct installation grant approach achieved first year customer level energy savings of 2,590,083 kWh in PY13, excluding the impacts from the SBDIL specifically for restaurants. Demand savings from this program in PY13 was 122 kW.

With the high electricity costs in Maui, it was a no-brainer for Teri Edmonds, owner of local shoe boutique, If the Shoe Fits, to participate in Hawaii Energy’s Free Small Business Direct Install Lighting Program. The lighting in her 13-year old Wailuku store was retrofitted with a mixture of energy-saving LEDs and CFLs. In addition to the 80% reduction in lighting energy use, the store has experienced improved lighting performance and lower cooling costs due to less heat from the lighting. If the Shoe Fits is expected to save an estimated 4,176 kWh or \$1,336 in electricity costs per year.

>> BUSINESS PROGRAM

Central Plant Optimization Program

This complex offer was phased out in PY12 due to poor cost effectiveness, complexities of installation and mixed energy savings results. It was replaced by our Central Plant Benchmark metering initiative. In PY13 we completed the evaluation phase of the three projects that were completed under this offer. The Queens Medical Center project produced an annual savings of 687,013 kWh and 112.2 kW. The property at 677 Ala Moana produced an annual savings of 224,717 kWh and 65 kW. Hale Pau Hana is an AOA on Maui. We executed a variant of the central plant optimization on their solar thermal hot water system. The project produced an annual savings of 27,820 kWh, but 0 kW due to peak period hot water requirements.

Central Chiller Plant Benchmarking Program

The Central Chiller Plant Benchmarking Incentive continued in PY13. It was designed to encourage business customers to install a central chiller plant metering and data logging system that will provide real-time data and trend data. This data reflects actual tons of cooling and measured efficiency in kW per ton. Many large commercial facilities, such as hotels and multi-level office buildings, lack information to determine whether their chiller plant is running efficiently or not. The new metering equipment makes it possible for the customer to understand the current operational and performance metrics of their Chiller plants and allows them to set meaningful energy efficiency goals and track progress towards those goals. Real-time and trend data is also available to engineers at Hawaii Energy via web interface, so that Hawaii Energy may increase its knowledge base and benchmark data related to typical chiller performance for various businesses on Oahu and the neighbor islands. Hawaii Energy incentivizes 100% of the equipment and installation and in turn has access to the data for five years after the project is complete. This will allow Hawaii Energy to not only benchmark performance but also track energy efficiency improvements directly influenced by data received from this program. A total of two projects were started and completed in PY13, with a total incentive expenditure of \$182,685.

For the last four years, the Four Seasons Resort Maui has been on an energy efficiency journey that has included the entire retrofit and upgrade of their central chiller plant (left) and other electrical equipment. A Building Automation System was also installed to monitor and control the environment and ensure the operational performance of the facility. The BAS system already helped identify an underground hot water leak and fine-tuned the waste heat recovery and storage system. It will also provide benchmarks on all equipment so that peak performance levels can be maintained in the future. Through their efforts, the Four Seasons Resort Maui received an incentive of \$347,000 from Hawaii Energy. They are expected to save an average of more than 2.7 million kWh per year and approximately \$810,000 annually in energy cost savings.

>> BUSINESS PROGRAM

Impacts

For PY13, the BESM Program achieved energy savings of 3,872,686 kWh (first year), an increase of 9% from the previous program year. Demand savings for the program in PY13 was 287 kW with \$1,596,568 in incentives. In relative terms, 7.8% of Hawaii Energy's incentives captured 3.0% kWh (first year) and 1.7% kW of the demand first year savings for PY13, but this program reached customers that would not otherwise have participated in the energy efficiency programs. **Table 49** provides a detailed breakout of the program.

- **#1 Contributor to BESM – Small Business Direct Install Lighting (70.8%)**

Small Business Direct Install Lighting offer was comprised of T8/T8LW, LED, CFL and Custom Lighting incentives and was the largest contributor to the BESM Program with energy (first year) and demand savings of 2,741,582 kWh and 128 kW, respectively.

| Table 49 BESM Program Impacts | | | | | | | | | | | | | | | |

BUSINESS PROGRAM

Expenditures

The Program had a material surplus in the BESM incentive budgets due to a conservative reallocation of funds to BESM in October (effective in January) to accommodate anticipated Small Business Direct Install Lighting projects on all islands.

See **Table 50** for details.

| Table 50 BESM Program Expenditures | | | | | |
|---------------------------------------|---------------------|---------------------|---------------|-------------------|-----------------|
| | Expenditures | R1 Budget | Percent Spent | Unspent | Percent Unspent |

| Total BESM | 2,308,971.68 | 2,491,141.00 | 92.69% | 182,169.32 | 7.31% |

» BUSINESS PROGRAM

Business Hard-To-Reach (BHTR) Program

Objective

The objective of this program was to help targeted geographies and demographics that have been traditionally underserved such as retail, restaurants and other small businesses. Additionally, this program conducted more aggressive outreach to lighting and electrical contractors with training, promotional materials and frequent communications on program updates.

Accomplishments

Direct Install Restaurant Lighting Retrofit

This offering targeted restaurants that have limited time and expertise to research lighting technology options, secure financing and hire contractors to replace their older, less efficient lighting technologies. This offering provided full energy-efficient lighting retrofits to restaurants in Hawaii, Honolulu and Maui counties at no cost to the customer. Trade allies recruited small businesses to participate, performed audits and executed the retrofits. This direct installation approach achieved first year customer level energy savings of 2,336,257 kWh. Demand savings for the customers for PY13 was 350 kW.

Impacts

For PY13, the BHTR Program achieved savings of 2,412,099 kWh (first year) and 340 kW savings with \$699,920 in incentives. In relative terms, 3.4% of the PBFA's incentives captured 1.9% kWh (first year) and 2.0% kW of the demand first year savings for PY13. **Table 51** provides the detailed measures contributing to this program.

| Table 51 BHTR Program Impacts | | | | | | | | | | | | | | | |

BUSINESS PROGRAM

Small Business Direct Install Lighting Program – Customer-Level Impacts

Customers participating in the SBDIL program should save over \$2,202,612 in operating expenses per year. Over the life of the lighting measures installed, the customers are expected to save over \$30,836,561. This is money that they can invest into business driving more job growth and profitability. See **Table 52** for further details.

The restaurant projects saw greater savings due to their longer hours of operation and more frequent change from incandescent to LED technology. The program cost-effectiveness of this program increased significantly in PY13 due to the elimination of the T8 to low-wattage T8 retrofits and concentration on T12 conversions.

| Table 52 SBDIL Customer Level Impacts by Island | | | | | | | |

RESIDENTIAL PROGRAM

Impacts

For PY13, Hawaii Energy's Residential program achieved savings of 71,241,873 kWh (first year) and 9,493 kW savings with \$9,230,037 in incentives. In relative terms, 45% of Hawaii Energy's incentives captured 56% of and 56.5% of kWh (first year) and kW savings, respectively. See **Table 54**.

| Table 54 Residential Program Impacts | | | | | | | | | | | | | | | |
|---|------------------|---------------------|-------------|---|-------------|-----------------------------|-------------|------------------------------|------------|------------------------------|-------------|---------------------------|-------------|--------------------|-------------|

» RESIDENTIAL PROGRAM

Expenditures

In PY13 the program successfully distributed 97.2% of residential incentive funds reaching 99% of the first year kWh target and 96% of the kW savings target. The year ended with a total incentive spend of \$9,230,037 leaving only a small surplus of \$266,063. Residential Energy Efficiency Measures (REEM), which represents the backbone of the residential portfolio, utilized 99.7% of its budget. Residential Energy Services & Maintenance (RESM) was also particularly successful this year as, with the economy rebounding, many new construction projects that did not get completed in PY12 hit in PY13. Similar to PY12, the modest budget for Customized Solutions for the Home (CESH) played a small role in role in PY13.

The Residential Hard-to-Reach program executed 52 solar water heating system direct install projects on Hawaii Island and Maui. Additionally, together with the Transformational team, the Residential Hard-to-Reach program funded the Hui Up refrigerator trade up on Molokai. Through collaboration with local community agencies the team identified a number of similar worthy opportunities to be implemented during Program Year 14. Despite a year of significant program activity, the Residential Hard-to-Reach budget closed PY13 with a \$180k or 27% surplus. See **Table 55** for details.

| Table 55 Residential Program Expenditures | | | | | |

RESIDENTIAL PROGRAM

Residential Trade Allies

Background

The residential trade allies include product manufacturers, wholesalers, retailers and contractors. These companies range from global entities to local proprietorships and all play a vital role in the Program's success. Some are on the front lines selling energy-efficient products, while others are behind the scenes delivering appliances and recycling those which have been replaced. In all, Hawaii Energy continued to enjoy the support of almost 200 unique companies playing a role in driving energy efficiency in the residential market. See **Table 56** for additional details on trade ally activity.

Trade Ally Program Outreach and Feedback

Hawaii Energy solicits feedback on a daily basis when contractors call in for work orders, or when the Program delivers applications to retailers. As a result, we have enhanced our trade ally experience across all programs by introducing a *Participation Application*, further streamlining the participation process. We also improved our Program communications to participants by tailoring the delivery method to the target recipient. The Program enhanced web site resources to encourage self-service, sent direct emails, utilized standard USPS letter mailings and increased phone contact with authorized principals/points of contact. Program representatives also engaged in multiple retail and commercial events with our partners in order to spread the word about Hawaii Energy offerings.

Ongoing Quality Assistance

In PY13, the Residential program continued to enhance the quality of programs offered through trade allies. Dovetailing on the success of the solar water heating contractor quarterly score cards initiated in PY12, in PY13 the Program began featuring top performers in the Hawaii Energy residential e-newsletter. These efforts continue to keep quality at the forefront of our participating contractor's attention. The Program actively coaches contractors experiencing challenges that arise from time to time, which continues to be well received.

| Table 56 Residential Trade Ally Projects | | | | | | |
|---|------------------|------------------------------------|---|--|--|--------------------|
| Trade Allies | Measures | Customer Level Demand Savings (kW) | Customer Level Energy Savings (kWh 1 st Yr.) | Customer Level Energy Savings (kWh - Life) | Cumulative Customer Level Energy Savings (%) | Incentives |

» RESIDENTIAL PROGRAM

Residential Energy Efficiency Measures (REEM) Program

Objective

This program consisted of five major initiatives including:

- High Efficiency Water Heating
- High Efficiency Lighting
- High Efficiency Air Conditioning
- High Efficiency Appliances
- Energy Awareness, Measurement and Controls Systems

The largest offer, involving CFLs, was administered through indirect upstream incentives to customers via lighting distributors and manufacturers. Second to the CFL offering was the Peer Group Comparison program, which was expanded to an additional 57,500 households on Oahu. The third largest offer in PY13 was LEDs, which saw a unit increase of over 200% from PY12.

In summary, rounding out the top three initiatives for first year kWh savings were CFLs, Peer Group Comparison and LEDs. This demonstrates a visible shift in the program as in PY12, the second and third largest offerings were Solar Water Heating and Refrigerator Trade-In, respectively.

Impacts

For PY13, the REEM program achieved savings of 67,307,632 kWh (first year) and 9,463 kW savings with \$8,180,046 in incentives. In relative terms, 89% of Residential program incentives captured 94.5% and 99.7% of kWh (first year) and kW savings, respectively. See **Table 57** for details. The three largest contributors were:

- **#1 Contributor to REEM – CFLs (70.7%)**

CFLs were the largest contributor to the REEM Program savings with energy (first year) and demand savings of 47,590,167 kWh and 6,555 kW, respectively. In terms of first year energy savings, the reliance on CFLs dropped approximately 3% with CFLs accounting for 70.7% of REEM savings in PY13 down from 74% in PY12. The overall unit count of CFLS decreased by 272,000 from PY12 resulting in an absolute savings reduction of about 8%.

- **#2 Contributor to REEM – Peer Group Comparison (7.2%)**

The Peer Group Comparison Home Energy Report program was the second largest contributor to the REEM Program in terms of first year energy savings. In PY13 the program expanded to an additional 57,500 homes on Oahu resulting in a total of 132,500 recipient households in the program. Despite the expansion, the program contributed 4,819,509 kWh in first year savings, a reduction of over one million kWh from PY12.

- **#3 Contributor to REEM – LEDs (6.2%)**

LEDs were the third largest contributor to the REEM Program savings with energy (first year) and demand savings of 4,167,833 and 753, respectively. This performance was an increase of over 300% from PY12. Moreover, with a measure life of 15 years, LEDs contribute over 12% of REEM lifetime energy savings.

Table 57
REEM Program Impacts

| Category | Units | Program Demand (kW) | % | Program Energy (kWh 1 st Year) | % | Program Energy (kWh - Life) | % | Average Measure Life (Yrs) | TRB/ TRC | Total Resource Benefit (TRB) | % | Total Resource Cost (TRC) | % | Incentives | % |

» RESIDENTIAL PROGRAM

Expenditures

In PY13, the Program utilized 99.7% of available incentive funds, realizing a small surplus of only \$25,651.41. Among the mix of measures in the PY13 plan, the Solar Water Heating Tune-Up offer was originally planned for the Residential Energy Services and Maintenance (RESM) program but was in fact charged to REEM funds, further contributing to the distribution of almost the entire budget.

See **Table 58** for details.

| Table 58 REEM Program Expenditures | | | | | |
|---------------------------------------|------------------------|------------------------|---------------|--------------------|-----------------|
| | Expenditures | R1 Budget | Percent Spent | Unspent | Percent Unspent |
| REEM Operations | \$2,329,403.41 | \$2,331,529.00 | 99.91% | \$ 2,125.59 | 0.09% |
| REEM Incentives | \$8,180,045.59 | \$8,205,697.00 | 99.69% | \$25,651.41 | 0.31% |
| Total REEM | \$10,509,449.00 | \$10,537,226.00 | 99.74% | \$27,777.00 | 0.26% |

Overall Accomplishments

Popular Offerings

Figure 7 summarizes the participation of REEM incentives by measure.

Quality Customer Support

During PY13, Hawaii Energy's residential call center handled over 12,663 customer calls ranging from, "What kind of refrigerator should I buy?" to, "What is the difference in solar technologies offered to heat to my water?", and "What can we do to lower our monthly utility bill?" We saw that 989 of the customers calling were concerned about their energy usage related to the Peer Group Comparison (Opower Home Energy Report), although a few opted out of the report (less than 1 percent). Most were pleased with the reports and were very interested in looking at decreasing their usage. The call center team was able to manage the coverage of these calls while maintaining an eight (8) second average answer rate with less than 1% abandonment rate for all customer calls.

» RESIDENTIAL PROGRAM

"As a retired, blind person, I live on a very modest, fixed income in a small, one-bedroom apartment. The only way I can seem to keep up with the ever-growing cost of living is to find ways to lower or cut my expenses. Thanks to the Hawaii Energy Home Energy Reports, I've become more aware of my electricity usage compared to my neighbors. It became very clear that there was room for improvement and especially cost savings. So, I set out to make changes in my home to become more energy-efficient.

At its highest, my electric bill was as high as \$128 a month and my ranking was 28 out of 100 neighbors. After taking some steps to save energy such as replacing my old appliances with ENERGY STAR® models and reducing phantom loads by using power strips for my electronics, my electric bill dropped to as low as \$83 a month. I cut my bill by about 35% and my ranking moved up to as high as 8 out of 100 neighbors.

What's especially great is my kids are the ones who read my electric bill and the Home Energy Reports to me each month, so they are learning first-hand how going green can not only help save money, but also the environment.

This isn't the end of my energy-saving journey. I now plan to replace my water heater with a more energy-efficient tankless water heater and reduce my AC usage by installing ENERGY STAR® ceiling fans and a security screen door. I'm also making more of an effort to cook, do laundry and even take showers during off-peak hours. I would love to lower my bill even more and I know my kids would love to see their dad move up to #1!"

- K. Okazaki

Mililani Mauka resident

Customer Experience Management

The Program continued to successfully utilize its Customer Experience Management (CEM) tool, Medallia, for a fourth year. This software generates an automated customer email survey for the ENERGY STAR® rebate and Solar Water Heating program participants. In PY13, the Program sent out over 7,500 surveys to gauge customer experience with Hawaii Energy. With a response rate of over 33%, the overall satisfaction rating averaged 9.2 out of 10 in areas of field service, rebate satisfaction and willingness to recommend Hawaii Energy offerings. In PY13, Hawaii Energy logged only six (6) complaints, which is down from eight (8) complaints PY12 and 29 in complaints in PY11. For the most part, complaints revolved around customer perception issues and at the end of the calls the customers left with a better understanding of the Program's value.

Accomplishments by Incentive Offering

High Efficiency Water Heating (HEWH)

For PY13, the HEWH program achieved a savings of 4,465,133 kWh (first year) and 944 kW savings with \$2,349,800 in incentives. In relative terms, 28.7% of REEM incentives captured 6.6% and 10% of kWh (first year) and kW savings, respectively.

HEWH - Solar Water Heating (SWH)

Instant Rebate and Interest Buy-Down Program – With 2,185 solar thermal systems installed and incentivized either directly or through participating lenders, the Program saw a steady performance in PY13. Solar water heating was the fourth largest contributor to the REEM Program savings with energy (first year) and demand savings of 3,912,723 kWh and 872 kW, respectively. At the close of the year, the Program had 89 participating contractors.

The solar interest buy-down option, known as "Hot Water, Cool Rates," continued to remain a selling tool for the Program's participating contractors, however, when given the option, customers typically opt for a no-financing solution. Additionally, the popularity of photovoltaics (PV), despite the recommended loading order (i.e., solar water heating first, PV second), continues to overshadow the potential of solar water heating.

Solar Water Heating Inspections – 85% of installations were inspected in PY13. The Program uses an algorithm to select systems to be inspected based on a number of factors including first-pass rates, however, inspections will also be conducted on an as-requested basis. This has helped to lower administration costs, while not sacrificing quality.

» RESIDENTIAL PROGRAM

Heat pump water heaters reached 87% of target with 261 units rebated. While about 18% less units were rebated than in PY12, this technology still represents as a viable option for smaller households. See **Table 59** for details of the High Efficiency Water Heating offers.

RESIDENTIAL PROGRAM

Participating Contractor Meetings

Hawaii Energy continued to meet with its network of Participating Contractors on Oahu, Maui and Hawaii islands. These half-day sessions provided a forum to update contractors on Program results, introduce new programs like the Solar Water Heating Tune-Up and give an opportunity for honest and open dialogue aimed to improve the Program. This year, the agenda was broadened from solar to all of the Program's residential offerings and the upcoming On-Bill Financing programs.

Solar Water Heating Tune-Up Program

The PY13 Solar Water Heating Tune-Up program provided a \$150 rebate to help offset the cost of maintenance for existing solar hot water systems. This program was carefully designed using input from the PY11 Tune-Up Pilot and included a key maintenance checklist to address system performance and longevity. The new offer also streamlined the application process for the contractors. This Tune-Up program far surpassed the initial expectation of 150 rebates, closing out the program year with 826 in total.

Data from the PY13 Solar Tune-Up program is still being analyzed but based on participating contractor feedback there were a few key takeaways, including: (1) the Tune-Up program contributed to more program participation at a time of the year when the industry is historically slow; and (2) the use of Hawaii Energy's co-branded marketing materials helped increase customers' awareness about the importance of solar water heating system maintenance and care.

For Hawaii Energy, the Tune-Up provided an opportunity to collect data on system condition and overall performance. For instance, although it is generally recognized that one of the primary causes of unrealized energy savings from solar water heating is the misuse of system timers, the Program had not performed any quantitative analysis to validate this. The initial Tune-Up data review showed that 28% of timers were either not functioning or not in use. These findings confirm what was previously suspected and, as a result, the Program is now planning for an increased educational campaign surrounding timers in PY14.

Additionally, findings from the Tune-Up program indicated that 60% of all anode rods were in fair or poor condition. As this is a common failure point with solar hot water systems, the Tune-Up required anode rod replacement plays an important role in decreasing the chance of early system failure. Contractors also documented that 87% of the systems serviced were in "Good" or "Excellent" condition, only 4% of systems had existing leaks, and five systems serviced were over 30 years old.

The Program utilized geographic information systems (GIS) mapping tools to analyze the location of PY13 Tune-Up participants in comparison with the PY11 pilot. Interestingly, the concentration of tune-ups performed shifted from the majority of participation taking place on neighbor islands in PY11 to

| TUNE-UP CHECKLIST | | |
|--|----------------|-----------------|
| Below is a list of items that will be checked during your tune-up. | | |
| | ACTIVE SYSTEM* | PASSIVE SYSTEM* |
| Verify proper settings for electric water heater timer | • | • |
| Verify set point on electrical backup | • | • |
| Test controller and sensors for proper operation per manufacturer's instructions/verify wiring integrity | • | • |
| Test for proper operation of circulating pump | • | |
| Inspection/cleaning of internal tank | | • |
| Verify proper operation of temperature gauges | • | • |
| Replace tank anode rod | • | |
| Tank flush | • | • |
| Flush collectors from hose bib at tank | • | • |
| Check system for leaks | • | • |
| Check and replace worn insulation | • | • |
| Apply UV coating to all existing and new pipe insulation | • | • |
| Test for proper operation of check valve and relief valves | • | • |
| Check condition of collectors, collector structure and roof penetrations | • | • |
| Clean panels | • | • |
| *To verify your system type, contact a participating contractor. | | |
|  Hawaii Energy YOUR CONSERVATION & EFFICIENCY PROGRAM | | |

RESIDENTIAL PROGRAM

higher concentrations in windward Oahu in PY13. In PY14 we will be further analyzing overall system condition with available solar data to assess system performance in the hottest sun zones.

These observations are important as they allow Hawaii Energy to better evaluate the accuracy of the existing Program Standards and Specifications and identify areas that need to be addressed. Initial results were presented to contractors at the bi-annual Contractor Meetings, which led to a number of additional requests for data analysis from contractors.

High Efficiency Lighting

For PY13, the High Efficiency Lighting Program achieved savings of 51,758,000 kWh (first year) and 7,308 kW savings with \$3,339,820 in incentives. In relative terms, 40.8 % of REEM incentives captured 76.9% of kWh (first year) and 77.2% kW savings, respectively.

The program moderated the volume of CFLs to a level of 1.5M (down from 1.7M) while maintaining an average incentive of \$1.18. PY13 saw the LED market make even greater strides in qualifying products for the residential market. The 287,647 rebated units reflect an increase of 320% over PY12.

Much effort was spent maintaining program participation with both manufacturers and retailers gained in PY12. Hawaii Energy was also able add many additional partners to our team in PY13. Among the larger manufacturers, Cree and Westinghouse joined the mix. The Program also recruited some smaller niche manufacturers such as Green Creative, Satco, Energy Mad and Light Bulb Source along with a few other distributors/retailers that work in the hardware, grocery and direct-to-consumer lighting markets. Feedback showed that increased retailer education along with the proper selection of lighting products really drives customer adoption.

See **Table 62** for details.

The above heat map shows the concentration of Tune-Up participants. Orange points show participant locations. Blue areas reflect lower density, red is medium density and yellow areas show the highest concentration of tune-ups performed.

Table 62
REEM High Efficiency Lighting Program Impacts

RESIDENTIAL PROGRAM

High Efficiency Air Conditioning

For PY13, the High Efficiency Air Conditioning Program achieved savings of 1,231,299 kWh (first year) and 375 kW savings with \$275,615 in incentives. This represents a 140% increase in savings from PY12. In relative terms, 3.4% of REEM incentives captured 1.8% and 4.0% of kWh (first year) and kW savings, respectively.

For PY13, the program held multiple meeting with major manufacturers and distributors as a means to gather feedback on their experience with current and historical Hawaii Energy rebate offerings. This intelligence gathering allowed the Program to better gauge the in the energy efficiency space within the AC market. It also provided an opportunity for dialogue regarding the deemed savings for applications in residential air conditioning, thus allowing better analysis of program cost effectiveness. These conversations were integral in the design of the Window AC Trade-Up and VRF program modifications to be implemented in PY14.

Solar Attic Fans and Whole House Fans, introduced in PY10, continued to show steady demand.

See **Table 63** for details.

| Total | 4,489 | 375 | 100% | 1,231,299 | 100% | 14,370,996 | 100% | 11.7 | 1.2 | \$2,515,082 | 100% | \$2,185,876 | 100% | \$275,615 | 100% |

High Efficiency Appliances

For PY13, the High Efficiency Appliances Program achieved savings of 5,029,125 kWh (first year) and 284 kW savings with \$958,910 in incentives. In relative terms, 11.7% of REEM incentives captured 7.5% and 3.0% of kWh (first year) and kW savings, respectively. Since PY09, Hawaii Energy has continued to expand its retail community to Hawaii and Maui counties, with a current total over 200 retail participants. This includes many new independently owned retailers along with all of the “big box” retailers in the State. Hawaii Energy’s Trade Ally Team regularly visited all retailers throughout the program year to keep them current on rebate levels, promotions and to ensure proper display of Hawaii Energy’s Point-of-Purchase (POP) collateral. Throughout the program year, retailers were regularly updated via emails and phone calls.

RESIDENTIAL PROGRAM

As ENERGY STAR® products become more common (and non-ENERGY STAR® models become less available), the Program has continued to curtail rebate offerings for some common ENERGY STAR® products. In order to moderate demand and manage the available PBF funds, the Program continued to offer the Refrigerator Trade-Up program in four (4) batches throughout PY13 and secured 3,863,029 kWh savings from this offer, reflecting 77% of the High Efficiency Appliance Program. This performance was consistent with PY12 in both scale and contribution to the REEM portfolio. The ENERGY STAR® clothes washer and VFD Controlled Pool Pump offers held steady in PY13 with 4,096 and 258 units, respectively.

Garage Refrigerator/Freezer Bounty Program – In PY13, the Refrigerator/Freezer Bounty Program was updated with the creation of Rid-A-Fridge to Fight Hunger, a partnership between Hawaii Energy and the local food banks. As an enhancement to the Bounty program, which offers a rebate to customers who unplug and recycled a working refrigerator and/or freezer, Rid-A-Fridge allows customers to donate their rebate directly to their local food bank by simply checking a box on their application. At the conclusion of PY13 almost \$3,000 had been donated to food banks on Oahu, Maui and Hawaii Island.

See **Table 64** for details.

Energy Awareness, Measurement and Control Systems

For PY12, the Energy Awareness, Measurement and Control Systems Program achieved savings of 4,823,246 kWh (first year) and 551 kW savings with \$1,255,750 in incentives. In relative terms, 15.4 % of REEM incentives captured 7.2% and 5.8% of kWh (first year) and kW savings, respectively.

Peer Group Comparison – In PY13, Hawaii Energy expanded the Home Energy Report program to include an additional 57,500 households on Oahu resulting in a total of 132,500 participating households at the close of the program year. The Home Energy Report consists of an outbound mailer measuring a home's energy use against 99 homes in their peer group (i.e., similar sized home and demographics). Initial calls from new customers responding to mailings ranged from general inquiries about the program to anger (e.g., save paper, privacy, low ranking). This was the expected outcome of the mailers, which are designed to elicit a strong response followed by behavioral changes. Customers were shown how to log in to their account and enter information specific to their home, followed by a discussion of how they could save money. Typically during the call, customers

RESIDENTIAL PROGRAM

decided to continue their participation in the program. Hawaii Energy continues to maintain the lowest attrition rate nationwide with the Peer Group Comparison report. In all, 4,819,509 kWh savings came from this offer, reflecting 99.9% of the Energy Awareness and Control System program.

Room Occupancy Sensors – Despite a relatively strong start for room occupancy sensors through upstream distribution channels, the program suffered from a premature cancellation when the sole participating retailer ended the offering due to their internal program restructuring.

Whole House Energy Metering – Hawaii Energy soft-launched this offer with a variable rebate in PY10. Although there has been low participation over the last few years, the Program is further researching the available technologies and devising a strategy to increase targeted participation for PY14.

See **Table 65** for details.

» RESIDENTIAL PROGRAM

Custom Energy Solutions for the Home (CESH)

This incentive category provided a measure of flexibility within the prescriptive portfolio to accommodate unforeseen market opportunities with budgetary and unit cost targets to provide financial efficacy guidance to the Program and allies who champion these opportunities.

In PY13, the program rebated three custom lighting proposals for specialized residential LED lighting applications. All other opportunities were addressed through the other programs (e.g., REEM, RESM and RHTR). As the market continues to evolve in PY14, the Program anticipates increased activity for this incentive category.

See **Table 66** and **67** for details.

| Table 66 CESH Program Impacts | | | | | | | | | | | | | | | |
|----------------------------------|-------|--------------------------|--------|---|--------|----------------------------------|--------|---------------------------------|-------------|-----------------------------|--------|--------------------------|--------|--------------|--------|
| Category | Units | Program Demand % (kW) | | Program Energy % (kWh 1 st Yr.) | | Program Energy % (kWh - Life) | | Average Measure Life (Years) | TRB/ TRC | Total Resource % Benefit | | Total Resource % Cost | | Incentives % | |

>> RESIDENTIAL PROGRAM

Residential Energy Services & Maintenance (RESM) Program

Objective

The Residential Energy Services and Maintenance program targets ally-driven service offerings to enhance energy savings persistence and bootstrap fledgling energy services businesses trying to secure a toehold in Hawaii. For PY13, the RESM Program achieved savings of 3,758,500 kWh (first year) and with \$555,000 in incentives specifically for the Efficiency Inside Home Design Program. The Solar Water Heating Tune-Up, while originally budgeted for the RESM program, was charged under REEM during PY13.

Accomplishments

Residential Design and Audit Programs – Efficiency Inside Home Design

Introduced in PY10, this program requires energy modeling to make comparisons between energy code-compliant designs and enhanced designs. Since this program's inception, Efficiency Inside has given Hawaii Energy the unprecedented opportunity to dive into the key characteristics of home energy use in Hawaii. Hawaii Energy has also established and maintained a productive relationship with a number of developers, modeling and testing consulting firms. In PY13, 925 homes were modeled across 13 communities, including one on Maui.

This approach has demonstrated the following progress the last four years:

- PY10: Collaboration with Home Energy Rating System (HERS) raters to develop program measurements and verification;
- PY11 and PY12: Gathering of data about home construction techniques and standard operation; recruitment of developers to participate in home energy design; and
- PY13: Use of utility data to determine actual home energy usage and compare with as-designed specifications.

In PY13 the Program was able to combine Efficiency Inside collected data with actual home energy usage data, and perform enhanced analysis. Some preliminary findings show:

- Homes are constructed such that they will consume up to 17% less energy than a baseline code built home ("baseline code" being IECC 2006 with solar water heating).
- Non-PV homes in the Ewa plain use on average 580-680 kWh/month, which is slightly less than, but in line with the Kapolei average of 705 kWh/month for a non-PV home.
 - The Program estimates that air conditioning could account for up to 68% of these new home's energy usage; and that
 - Many homes show no sign of energy usage from air conditioning.
- Air conditioning drives home energy usage in hotter Hawaii climates.
 - **Figure 8** displays monthly energy costs for 67 new homes of the exact same model and neighborhood.

» RESIDENTIAL PROGRAM

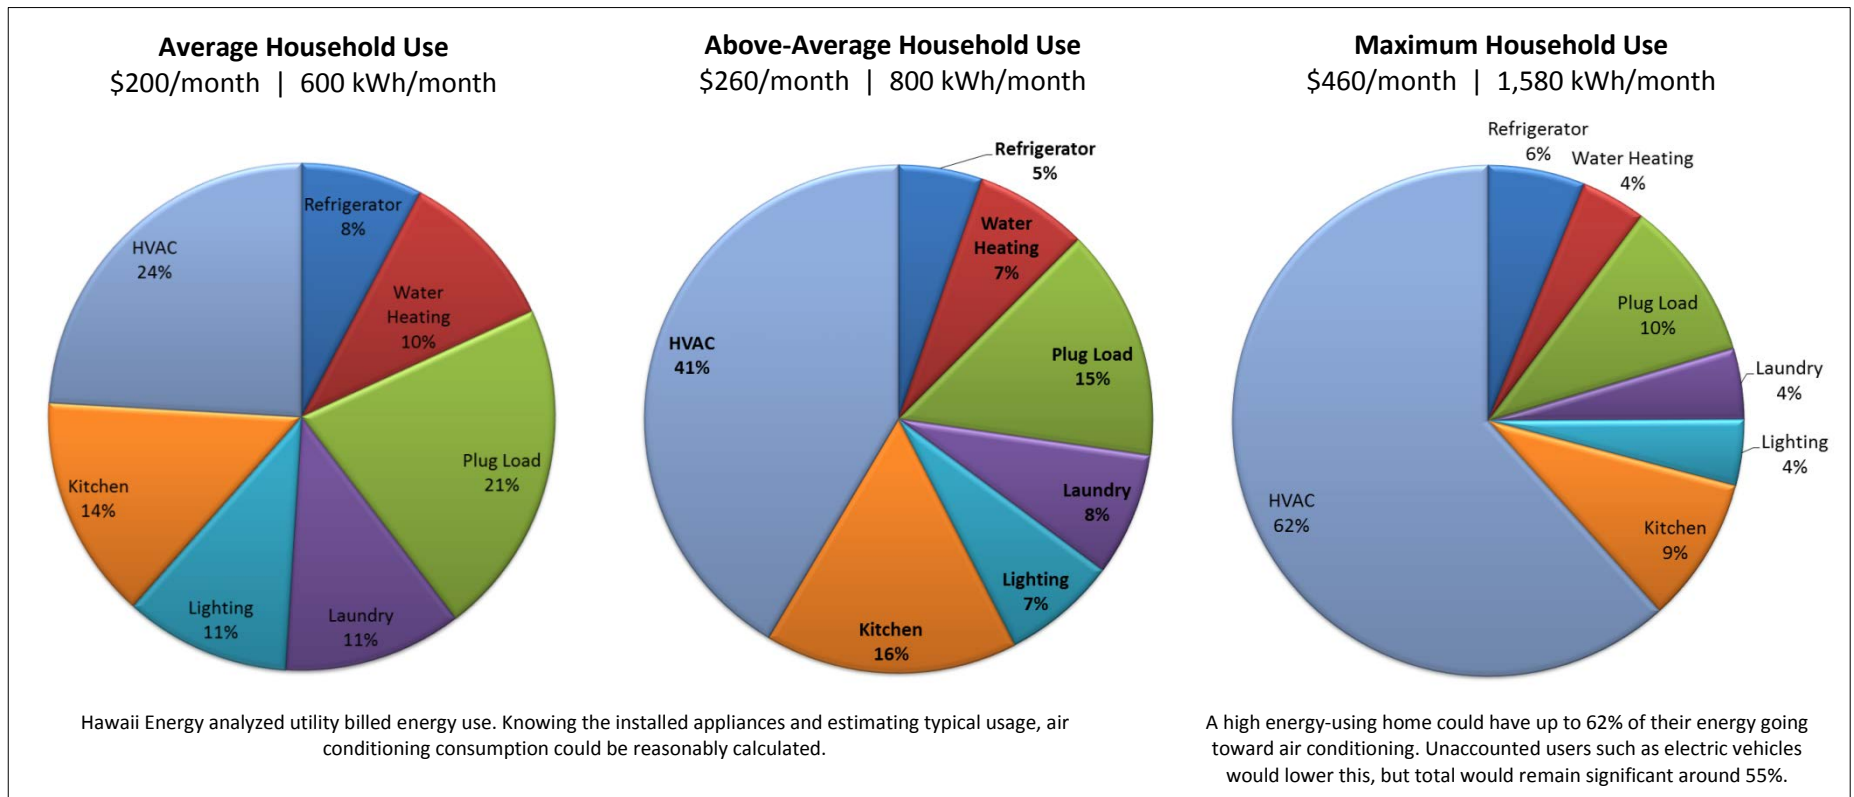

- **Figure 9** shows 3 charts of estimated home energy use breakdowns corresponding to the Average use, Above Average use, and Maximum use circles in Figure 8.

Figure 8

>> RESIDENTIAL PROGRAM

Figure 9 – Evolution & Comparisons of Residential Electricity Use

The Hawaii Energy Program has also gained the following insight:

- The Energy Policy Act forbids requiring equipment efficiencies higher than those cited in the Act, which is currently 13 SEER for residential air conditioning. However, some forward thinking builders in Hawaii outfit new homes through this program with much higher efficiency units in the 16 SEER range.
- HERS raters are suggesting the next steps for new construction home design:
 - Right-size air conditioning using Manual J and verifying compliance via 3rd party assessment; and
 - Increase building tightness.
- Net-Zero homes are being built with the following conditions:
 - Constructed with 1 kW PV installed; and
 - EV-ready

RESIDENTIAL PROGRAM

In PY14, the traditional Efficiency Inside program will come to a close with just 100 home incentives remaining. The Program plans to use the data gathered over the last four years to work more closely with developers and residents, and provide data in a meaningful way that will encourage behavioral changes in energy usage. It will also explore Demand Response and SmartGrid programs that will provide usage information to the residents allowing them to be better informed and encouraging energy management.

Impacts

For details, see **Table 68**.

| Table 68 RESM Program Impacts | | | | | | | | | | | | | | | |
|----------------------------------|-------|--------------------------|--------|---|--------|----------------------------------|--------|------------------------------|---------|--------------------------|--------|-----------------------|--------|--------------|--------|

Expenditures

In PY13, the Efficiency Inside Home Design program spent \$555,000, 99.7% of the incentive budget.

See **Table 69** for details.

| Table 69 RESM Program Expenditures | | | | | |
|---------------------------------------|---------------------|---------------------|---------------|--------------------|-----------------|
| | Expenditures | R1 Budget | Percent Spent | Unspent | Percent Unspent |
| RESM Operations | \$74,042.06 | \$74,263.00 | 99.70% | \$220.94 | 0.30% |
| RESM Incentives | \$555,000.00 | \$590,000.00 | 94.07% | \$35,000.00 | 5.93% |
| Total RESM | \$629,042.06 | \$664,263.00 | 94.70% | \$35,220.94 | 5.30% |

>> RESIDENTIAL PROGRAM

Residential Hard-To-Reach (RHTR) Program

Objective

The Residential Hard-To-Reach program seeks to secure various projects among geographies and demographics that have been traditionally underserved. This incentive category specifically addresses landlord/tenant barriers through direct installation of energy saving technologies.

Accomplishments

Solar Water Heater – Direct Install

In PY12 the Program worked with Hawaii County Economic Opportunity Council to install 169 solar water heating systems for “in need” families. It was determined that by collaborating on this project with the Program providing funding for solar water heating systems, HCEOC could extend its grant to help more families in other ways. For PY13 the program expanded its reach and collaborated with Maui Economic Development (MEO) to work with their identified hard-to-reach residents. At the conclusion of PY13, the Program had fully-funded a total of 52 solar water heating systems, 19 on Maui and 33 on Hawaii Island.

Molokai Hui Up

During PY13, Hawaii Energy partnered with the Blue Planet Foundation and Sust’AINable Molokai to execute a Hui Up on Molokai. The Residential Hard-To-Reach program supported this initiative with a \$250 incentive for a new ENERGY STAR® refrigerator for 220 households.

RESIDENTIAL PROGRAM

Impacts

During PY13 Hawaii Energy built on PY12 successes and continued to provide resources through major solar water heating grants and the refrigerator trade up program, Hui Up. Residential Hard-to-reach (RHTR) resources target traditionally underserved demographics. For PY13, Hawaii Energy's program achieved savings of 166,211 kWh (first year) and 23 kW savings with \$492,225 in incentives. In relative terms, 5% of Hawaii Energy's residential incentives captured 0.2% of kWh (first year) and kW savings.

See **Table 70** for details.

| Table 70 RHTR Program Impacts | | | | | | | | | | | | | | | |

TRANSFORMATIONAL PROGRAM

Introduction

In PY13, the Transformational program expanded its residential and business-related efforts to support three key areas, specifically: (1) Behavior Modification, (2) Professional Development and (3) Technical Knowledge and Training. An emphasis was placed on green workforce development and energy literacy through education in schools, households and communities at large. The underlying intent of these offerings is to transform the market through various means that will lead to gains through energy efficiency and conservation within three to five years. Through the expertise and collaboration of Hawaii Energy staff and subcontractors throughout PY13, the Transformational Program met and exceeded most of its goals and addressed some additional priorities that were recognized throughout the Program Year. See **Table 72** for details on Transformational achievements.

| Table 72 Transformational Achievements | | |
|---|--------------|--------|
| | Participants | |
| Category | Achieved | Goal |
| <i>Behavior Modification</i> | 23,297 | 18,000 |
| Helen Wai | 3,101 | |
| Kanu – Messaging | 19,394 | |
| Kanu – Devices | 300 | |
| UH Sustainability Summit | 297 | |
| Hui Up – BPF | 205 | |
| Energy Videos - BPF | N/A | |
| <i>Professional Development</i> | 1,336* | 1,000 |
| The NEED Project | 338 | |
| RISE - Kupu Hawaii | 6 | |
| UHWO - IFMA | N/A | |
| Hui Up - SMI | 12 | |

| BOC - UHMOC & SLIM | 51 | |
| W&WW Training | 124* | |

*Number of participants differs from value that was previously reported in PUC Monthly reports due to new information presented after June report was submitted.

» TRANSFORMATIONAL PROGRAM

Behavior Modification

Energy Literacy in Hard-to-Reach Communities

“Sharing the Aloha” Workshops – A Free Community Workshop with Helen N. Wai

For islanders living at or below Hawaii’s average income level, the apparent inability to control high electricity costs, let alone understanding energy, is a cause of great frustration. To address this, Hawaii Energy once again subcontracted Helen N. Wai because of her experience and success in providing face-to-face financial literacy instruction and guidance to Hawaii’s rural, low-income and Native Hawaiian-American families and communities over the past 15 years. Helen is Native Hawaiian, her family has been living on Hawaiian Homestead lands in Nanakuli, Oahu for generations, and she is well regarded by the local community, giving her credibility and access far beyond what Hawaii Energy would otherwise have.

In PY13, 3,101 participants attended 104 “Sharing the Aloha” workshops throughout the islands. Classes were augmented to address energy efficiency and enhanced with a complimentary energy-saving item for each participant. This free item encouraged participation and also helped attendees save energy.

Throughout PY13, the need for energy education in new venues was increasingly apparent. Individuals in the targeted demographics typically have multiple jobs, an extended family and children to care for, and therefore are not able to attend regularly scheduled community workshops. To address this barrier to participation, the Program began providing workshops at the residents’ place of employment during lunch times. These workshops were held for employees of hotels, resorts, supermarkets, hospitals, colleges and labor unions.

New this year, “Sharing the Aloha” did a joint community outreach event on Wednesday, May 28, 2014 at Office of Hawaiian Affairs’ (OHA) Kulana Oihi Halau on Molokai. The event followed the Maui County’s small business conference held at the nearby University of Hawaii (UH) Maui College – West Molokai campus. The target audience was small local businesses owners, families, past Hawaii Energy participants, as well as individuals interested in learning how to reduce their electric bills. The collaboration was successful, boasting an attendance of 124 people at this event.

Throughout the program year, Hawaii Energy received many positive emails and phone calls from workshop participants. Many of the participants felt empowered by the information and greatly appreciated Helen’s presentation, primarily because her compassion and use of local terms and phrases made it more relatable to their everyday lives.

About two years ago, we held a Sharing the Aloha workshop at the Kona Coast Resort for our employees. Because of the energy-saving information we learned at the workshop, the Resort Manager and I used a Belkin Conserve Insight Monitor to measure how much energy the four drink machines on our property used. They were each costing us \$100 a month to operate! We removed three of the drink machines and replaced the fourth with a new ENERGY STAR® machine. We’re estimated to save about \$3,600 annually!”

Rhonda Brown
Assistant Resort Manager
Kona Coast Resort

» TRANSFORMATIONAL PROGRAM

Energy Efficiency Literacy at Scale – Kanu Hawaii

Messaging

Hawaii Energy recognizes that the socioeconomic and cultural diversity in Hawaii presents a unique challenge for promoting energy efficiency and conservation. It often requires personal connections, relatable examples, pictures, or simple cultural phrases to capture and retain the public's attention and interest.

To help address this unique challenge, Kanu Hawaii was once again subcontracted to take on the following tasks: (1) educate/inspire action to save and conserve energy and (2) encourage sharing their experience with friends and family. Kanu Hawaii was selected because of its vision related to the above challenge and its mission to “empower people to build more environmentally sustainable, compassionate, and resilient communities rooted in personal commitments to change.” Kanu Hawaii is an ideal partner for Hawaii Energy due to its appreciation for Hawaii's unique way of life, its compassion for helping underserved families and its highly effective use of social media messaging tools.

In PY12, Kanu Hawaii worked with Hawaii Energy to identify ten (10) meaningful energy-saving activities relevant to Hawaii families and create messaging to communicate the value of these behaviors. Kanu Hawaii's interaction with a diverse set of communities identified the following energy saving opportunities to address: fans, air conditioners, entertainment centers, electric water heaters, showers and baths, refrigerators, kitchen appliances, clothes washers, power strips, and video games systems. A series of memes (defined as “an idea, behavior, or style that spreads from person to person within a culture”) were created by Kanu reflecting a sense of Hawaii's culture that identifies energy-saving activities in an attractive, relatable way. Once a person sees the meme in a printed document, webpage, blog or presentation, they are presented with additional information in infographics and/or videos that further explain the value of new behaviors that when adopted can result in energy savings.

In PY13, Kanu Hawaii built upon this foundation and created additional energy-saving memes, along with infographics and videos. They also produced energy education curriculum for adults and activity and coloring books for children. Both highlighted the creative energy-saving messages specifically designed for Hawaii's diverse population. Kanu's design approach made messages attractive and appealing to draw people in and motivate them to learn more about saving energy.

Kanu Hawaii tested the newly developed memes' “attractiveness” using Facebook to create discussions and engagements. In less than three months, Kanu had 614,572 social media views of which 19,394 people engaged (took action) using the newly created memes.

» TRANSFORMATIONAL PROGRAM

Devices

Since the Program began focusing on transformational programs, it became clear that many electric ratepayers lack access to simple energy-saving devices (e.g. timers, advanced power strips, etc.). For those that do, the standard instructions that accompany these devices are often difficult to understand leading to incorrect use or no use at all. Therefore, Kanu Hawaii was subcontracted to implement a carefully designed a 300-participant pilot that would overcome some known barriers and provide access to a simple device, while ensuring its proper use. With the findings, Hawaii Energy could develop subsequent offers that would be more likely to succeed, especially among hard to reach sectors.

Hawaii Energy and Kanu Hawaii chose a simple timer as the best energy conservation measure to pilot.

Access to this simple device was addressed by an innovative Pay-It-Forward model developed by Kanu Hawaii. The foundation of the Pay-It-Forward model is to provide a simple, satisfying and successful customer experience that will lead the customer to share their experience with others. Key to the customer's experience was the set of instructions provided with the timer. To maximize the Program's learnings, three subgroups were established, each receiving different instructions. The first group received the manufacturer's instructions; the second group received printed Kanu-developed instructions, while the third group received a Kanu-produced video with their timer. Each of the three groups was further divided into two groups: one receiving a timer with factory-set pins (e.g. on 24/day), while the other received a Kanu-set timer, which was preset to be off during the overnight hours. Kanu Hawaii successfully recruited 300 participants, divided into six (6) test groups that were then sent a package of two timers (one to use and one to Pay-It-Forward) and the instructions.

Kanu created special instructions to help participants understand and take action to curb energy consumption by using the device. Some of the key elements of the Kanu Hawaii produced printed instructions included a Hawaii-styled narrative, simple images and highlights to overcome confusion, suggested common household items with vampire loads and in general a "home-grown" or small business-like feel that was more welcoming.

Participants of the Kanu "Pay-It-Forward" project received two timers to help them reduce the energy usage for a single device in their home. After trying the device on their own, they were encouraged to pass the second timer to a family member or friend and show them how to save energy using it.

» TRANSFORMATIONAL PROGRAM

Kanu's video instructions featured Kanu staff demonstrating the setting and installation of the timer on an appropriate device.

The project was successful in a number of ways. The Program engaged participants from all islands and received valuable feedback, testimonials and pictures verifying correct installations. Hawaii Energy and Kanu learned that localized meme-based instructions (e.g. infographic) were the most successful tool in overcoming barriers to proper installation and use. And overall, participants had a positive experience resulting in 75% indicated they would Pay-It-Forward, meaning they would give their second timer to a friend and show them how to use it.

This pilot showed promise in developing an educational distribution model for low-cost energy-saving measures that can target the residential market. In the coming Program Year, Hawaii Energy intends to build upon this pilot as it continues to establish efficient ways to benefit the residential sector with low-cost conservation measures.

Second Annual Hawaii Sustainability in Higher Education Summit

University of Hawaii 10-Campus System, Hawaii Pacific University, Brigham Young University-Hawaii and Chaminade University

Hawaii Energy made a conscious effort to develop strong relationships within the University of Hawaii (UH) system in PY13. One aspect of this was continuing the financial and technical support for the University of Hawaii Sustainability in Higher Education Summit. The first event, held in PY12, exceeded its key intended outcomes and expectations, which included: (1) refining the draft UH System Sustainability Policy and (2) providing an opportunity for building cross campus collaborations by sharing insights and best practices. The 2nd Annual University of Hawaii Sustainability in Higher Education Summit was a three-day conference that took place March 13th - 15th, 2014 at the University of Hawaii Windward Community College in Kaneohe. Hawaii Energy was a gold sponsor for this event and participated in panel discussions.

The Summit was attended by 297 participants, including representatives from the University of Hawaii 10-campus system, invited guests and higher education colleagues at Hawaii Pacific University, Brigham Young University-Hawaii, and Chaminade University. The Summit's goal was to continue statewide higher education sustainability strategy, establish sustainability goals, share best practices and build long-term relationships to support campus efforts to move from vision to action in energy efficiency and broader sustainability efforts.

» TRANSFORMATIONAL PROGRAM

Marketing and Logistics Support for Residential Energy Literacy in Hard-to-Reach Communities

Hui Up 3.0 with Blue Planet Foundation and Sust`AINable Molokai

Based on previous success achieved on Molokai and Lanai, Hawaii Energy subcontracted Blue Planet Foundation and Sust`AINable Molokai (see *Professional Development*) to launch another round of Hui Up, the refrigerator exchange program, on Molokai. In addition to the refrigerator exchange, the Program added an educational component for energy efficiency and conservation by funding Sust`AINable Molokai to have their youth interns provide participants with a simple home energy assessment.

Blue Planet Foundation focused on effectively marketing this opportunity to Molokai residents, recruiting eligible participants and handling the logistical and fiduciary components involved in the refrigerator exchange. This resulted in 220 participant households exchanging their old, inefficient refrigerator for a new ENERGY STAR® refrigerator to reduce their energy bill.

The Hui Up program continued into its third year, sending youth interns into residents' homes and educating them about energy efficiency opportunities.

Energy Videos

Blue Planet Foundation

Hawaii Energy contracted with Blue Planet Foundation to produce two professional-quality videos introducing concepts surrounding energy use in small businesses and homes. The intention of the videos is to serve as an effective introduction to efficiency for these historically hard-to-reach business customers. These videos incorporated a local tone and style in order to most effectively communicate the message to Hawaii's small business and residential audience.

To the left are screen captures from the two energy videos created by Blue Planet Foundation. "Money Monster" (left) depicted some of the ways that small businesses tend to waste money in their facilities and "The Romero's" (right) featured Kehau and Mike Romero of Waianae, who shared their experience monitoring their home energy use and the positive changes they made as a result.

» TRANSFORMATIONAL PROGRAM

Professional Development

Energy Education in the Schools

The National Energy Education Development (NEED) Project

The National Energy Education Development (NEED) Project brings over 30 years of experience in energy education and has correlated their lessons and materials to Hawaii education standards. NEED programs are designed to practice student peer-to-peer teaching and cooperative learning. More importantly, NEED's student-directed activities empower students to take active roles in educating their peers, families and communities about energy issues and in identifying and solving the problems unique to their communities.

Throughout PY13, 338 teachers across Honolulu, Hawaii and Maui counties participated in NEED activities such as workshops, grants and development meetings. Major breakthroughs in penetration of the Hilo area of Big Island's population allowed us to surpass our goal of 275 teachers by 19%. These teachers were from 169 local schools and served a total of 18,738 students. Hawaii Energy now has a pool of teachers (contact list of 535 teachers) who they will continue to consult with and leverage to expand the energy education in the community.

The NEED Project workshops focused on developing a clear understanding of the science of energy and energy efficiency and conservation lessons for school, home and commercial applications. The two types of one-day workshops: Basic Energy Workshop and Building Science Workshop were offered to teachers providing training and curriculum materials for all grade levels and subject matter. Teachers were provided with professional development credits, a substitute reimbursement for their attendance, as well as energy learning kits to use in their classrooms. In addition, teachers who attended the NEED workshops were eligible for grants for up to \$2,500 throughout the Program year for projects that build capacity in energy efficiency and conservation. Five (5) grants were awarded to teachers at local schools ranging from \$500 to \$2,500.

Hawaii Energy also had unprecedented success in the historically hard-to-reach Hilo area. In PY13, the Program was able to reach the Hilo market for educators by forming relationships with local resource teachers and principals and leveraging those relationships to generate interest and awareness of the importance of the energy education workshops. The average NEED workshop attendance for the Hilo area in previous years was approximately 15. In PY13, the Hilo workshop was the largest with 60 participants and a waiting list. There were many requests during and after the workshop for more information regarding energy-saving tips and recommendations as well as requests for additional workshops from attendees. Hawaii Energy will continue to engage and support these teachers and will offer a second-level workshop, Building Science, in PY14.

NEED teachers had the opportunity to delve deeper into the NEED curriculum at the annual National Energy Conference for Educators held in July 2013. For PY13, the Program subsidized the travel and cost of attendance for three (3) Hawaii NEED teachers to participate in this five-day conference. This trip allowed them to explore the NEED curriculum further with their peers from across the country and learn from well-seasoned NEED teachers as their

Hawaii Energy subsidized travel and registration costs for three teachers so they could attend the National Energy Conference for Educators in July 2013.

» TRANSFORMATIONAL PROGRAM

facilitators. These three teachers have been very active in sharing and promoting the NEED curriculum and Hawaii Energy at community events and within their schools.

In June 2014, NEED and Hawaii Energy hosted their second annual Teacher Advisory Board (TAB) session. The TAB was comprised of ten (10) teachers who have participated in past NEED workshops. These teachers are highly motivated and have successfully implemented the NEED curriculum. The members of the second session were selected by Hawaii Energy and NEED staff to ensure that various types of schools from each island were represented. The TAB session, which was facilitated by both Hawaii Energy and NEED staff, served as a platform for teachers to discuss further developments that would support teachers in applying energy education in their curriculum. Hawaii Energy and NEED have taken these suggestions from the TAB meeting and have begun to integrate them into NEED curriculum and operations.

The TAB meeting was also used as an incubator for new ideas and initiatives. Based on feedback Hawaii Energy received from the third-party Measurement and Verification review, it was recognized that it would be beneficial for The NEED Project to have a more direct connection to the residential community with regard to energy education. The team worked with the TAB members to strategize about methods for effectively achieving energy savings in students' homes. It was mutually decided that the members of the TAB would pilot an Energy Expo with their students in the next academic year to involve parents and other community members in energy education. Two Energy Expos are already scheduled for PY14; these events will also serve as a platform to promote other Hawaii Energy offerings to ratepayers.

RISE (Rewarding Internships for Sustainable Employment)

Kupu Hawaii

The Program recognizes the need to prepare the next generation for green jobs and sees great value in green workforce development. Therefore, Hawaii Energy teamed up with the RISE Program operated by Kupu Hawaii to recruit, train and mentor six (6) interns for green workforce development. Through the RISE program, these college students and young professionals had paid internships working specifically in energy efficiency in the commercial, residential and agriculture sectors. These interns contributed to green initiatives with guidance and mentorship from Hawaii Energy and Kupu Hawaii staff. The interns supported Hawaii Energy's work in the field, performed market research on the agriculture sector, and worked with University of Hawaii (UH) staff on the Kukui Cup student dormitory energy challenge. In addition to their work in these sectors, interns attended Sustainability Seminar Series (S3) to build skills and their professional capacity, have access to rare insider opportunities to tour facilities, meet with leading experts in the State and nation, and keep abreast of current issues through networking, events and newsletters.

Although stationed on different islands, RISE interns gathered for several trainings in Honolulu to evaluate and discuss their experiences and learn new information about the Program.

» TRANSFORMATIONAL PROGRAM

Five (5) of the RISE interns worked with Hawaii Energy's Small Business Direct Install Lighting (SBDIL) program performing a total of 162 SBDIL post-inspections within Hawaii, Honolulu and Maui counties. They also conducted market research among contractors and participants in the Program to better understand their perceptions of the SBDIL program and Hawaii Energy. The interns produced a white paper and presented their findings and recommendations to Hawaii Energy at the end of the year. Recommendations included a request for a new data system for contractors and a need for better marketing and communication about the SBDIL program. These have all been considered and will be implemented in PY14.

One (1) intern oversaw the Kukui Cup program throughout the academic year. The Kukui Cup is a program to encourage the reduction of energy use in college student resident halls at the University of Hawaii at Manoa campus. The intern learned innovative behavior change techniques via "gamification", which involves social marketing, student activities and educational pedagogy. This intern produced a report and gave a presentation to Hawaii Energy staff on findings and recommendations for future implementations of the program. Findings suggest that leaders of the program needed to be involved for longer than one year in order to properly grow the program and have a lasting impact.

Four (4) of the interns performed market research on the local agriculture industry exploring energy efficiency opportunities in this sector. Although the agricultural sector is relatively small in Hawaii, their final presentation offered a number of ideas for Hawaii Energy to better engage farms and food manufacturers. Suggestions included additional technical workshops and website enhancements specifically for the agricultural sector among others.

Facilities Degree Program at the University of Hawaii West Oahu

University of Hawaii West Oahu & International Facility Management Association

In order to address the growing need for professional facilities management personnel, the International Facility Management Association (IFMA) Hawaii Chapter, University of Hawaii West Oahu (UHWO), and Hawaii Energy are collaborating on the creation of an innovative academic degree program that will prepare students for careers in facilities operation and management.

In PY13, Hawaii Energy provided the University of Hawaii Foundation with \$20,000 to support the development of the UH West Oahu Bachelor of Applied Science (BAS) Concentration in Facilities Management. This funding was utilized to retain a local expert to consult on the development of the degree program in relation to various stakeholder priorities. This energy consultant is tasked with identifying key industry partners, collaborating with UHWO administrative and faculty personnel to identify course content, identifying experts to serve as lecturers, and creating a strategic rollout plan for the program including a 3 to 5-year budget. The energy industry expert consultant will also be researching IFMA program certification in order to complement UHWO's existing courses with new construction, energy, and engineering coursework to meet industry workforce needs.

Because of this promising start, the University Foundation was able to successfully leverage the funding to secure an award of \$245,677 from the U.S. Office of Naval Research (ONR) to support the establishment of a STEM Center of Excellence and a BAS Concentration in Facilities Management program. In addition to the materials and equipment being purchased with the ONR grant, two UH West Oahu faculty members are currently researching the Facilities Management program curriculum in conjunction with the chosen energy industry consultant.

» TRANSFORMATIONAL PROGRAM

In PY14, Hawaii Energy plans to continue to support the development of this degree program through collaboration with the energy consultant, UHWO and IFMA Hawaii members. The Program plans to develop a three to five-year “Road Map” documenting the needed support from Hawaii Energy and the Hawaii IFMA Chapter that will be executed in parallel to UH West’s degree development work.

Green Workforce Development and Residential Energy Literacy in Hard-to-Reach Communities

Hui-Up 3.0 with Sust`AINable Molokai

Hawaii Energy subcontracted Sust`AINable Molokai and Blue Planet Foundation (see *Behavior Modification*, page 120) to launch Hui Up 3.0 on Molokai, a refrigerator exchange program with an educational component to improve the energy literacy of participating households. The professional development and education aspects of this project were driven by Sust`AINable Molokai, which recruited and trained a team of twelve (12) local youth to convey energy efficiency and conservation information, tips and practices to participating households. In addition to providing this in-home training, these youth performed 205 home energy assessments with a focus on plug loads, particularly focused on the refrigerators they encountered.

Energy Efficiency Sales Professional Training

EEFG® - Mark Jewell, President

Recognizing that educating energy conservation and efficiency sales and advocacy professionals could lead to broader Program participation, Hawaii Energy continued to subcontract Mr. Mark Jewell of Energy Efficiency Funding Group (EEFG) in PY13. EEFG is a training and education services firm based in California and its principal, Mr. Jewell worked in commercial real estate investment for over 15 years before becoming a nationally recognized expert on energy efficiency. In PY13, a total of 980 individuals participated in the following offerings.

The Hawaii Energy Workshop Series

In advance of the Hawaii Energy Workshop Series V (HEWS V) being offered, EEFG conducted an introductory webinar entitled, “Finding the Value in Efficiency” to which a total of 66 individuals subscribed. The webinar touched upon assessing energy-saving potential, calculating returns and securing approval for projects, while identifying which upcoming courses would provide more detail on each of the topics presented.

Later in PY14, EEFG offered eight (8) topics for the Series both in-person and on-demand, including:

1. Learning to S.E.E. (Sell Efficiency Effectively)
2. Financial Analysis for Energy Efficiency Projects - Beginning
3. Financial Analysis of Energy Efficiency Projects - Intermediate

Some of the more than 200 participants that attended Mark Jewell’s workshops this program year.

» TRANSFORMATIONAL PROGRAM

4. Financial Analysis of Energy Efficiency Projects - Advanced
5. Taking Control of Your Energy Use
6. Making Efficiency Happen
7. Benchmarking Your Commercial Building and What's Next After Benchmarking?
8. Benchmarking as a Business

In general, these courses are intended to stimulate energy efficiency sales activity within Hawaii Energy's island territory, particularly among the medium-sized commercial customers, and to provide professional development to those selling energy-efficient equipment/services to that market. While the Program had only offered in-person courses in the past, the on-demand (online) series enabled professionals to participate despite travel constraints. Once registered, these participants have access to their chosen courses for one full year and is intended be a resource to apply lessons learned, while being able to return to the online courses for reinforcement. A total of 832 individuals participated in these courses, with 224 attending the in-person classes at the Double Tree Hilton Alana Waikiki Hotel on Oahu Island, while the balance of 608 registered for the on-demand courses.

Post-surveys for the Series were very positive and anecdotally implied that the Program could increase participation through Webinar versions of these courses. As expected, the majority of attendees plan to use the knowledge and skills gained from the course to increase efficiency/renewable utilization by their customer or client's facility.

The Efficiency Sales Professional Boot Camp

EEFG also offered the Efficiency Sales Professional™ (ESP) Certificate Program, which is an intensive, six-day session including 48 hours of training on sales, energy efficiency, financial analysis, and personal productivity. This robust course included 24 learning modules teaching participants to find the highest valued targets and capture their attention, to map the decision-making chain and skillfully assess motivations, to concisely communicate value and artfully blend emotion and logic to neutralize objection to gain approval, and to replace myth with math and motivation to escape the clutches of simple payback period.

At Hawaii Energy direction, EEFG contacted highly valued local organizations to notify them of the Boot Camp and encourage their members to participate. Over the course of the Series, more than 50 relevant member organizations (e.g., BOMA, AIA, USGBC, and IFMA) were solicited to attend. Ultimately, 27 participants attended the certificate program during the week of May 5th at the Double Tree Hilton Alana Waikiki Hotel on Oahu Island.

Post-surveys revealed that both Mr. Jewell and the courses were extremely well-received and valued. Many attendees commented on the abundance of valuable practical course material alongside expressions of gratitude to have the opportunity to attend these high-level trainings at such an affordable cost.

Mark Jewell's Presentation to UH Board of Regents and Facilities Staff & Video Supplement

The University of Hawaii represents one of Hawaii's most significant energy consumers. On May 8, 2014, Mark Jewell delivered a keynote presentation at the Information Technology Center of the University of Hawaii Manoa Campus to an audience of 55 leaders and other important stakeholders in the

>> TRANSFORMATIONAL PROGRAM

University's energy-related planning and projects. This event was a catalyst for more engagement with the UH System and Hawaii Energy leading into PY14.

EEFG also produced a reenactment of that keynote, a Vimeo-format video of approximately one hour using "green screen technology", featuring Jewell as the speaker with selected PowerPoint slides inserted as the background. This video will be used as an ongoing introduction to staff as Hawaii Energy continues working with UH.

Mark Jewell giving a special presentation to campus leaders and stakeholders at the University of Hawaii at Manoa

» TRANSFORMATIONAL PROGRAM

Technical Training

Certified Energy Manager (CEM), Energy Manager in Training (EMIT) and Online Training

Association of Energy Engineers (AEE)

Since PY11, Hawaii Energy has worked with AEE to hold training seminars and certification programs in Hawaii. Objectives of the program were to strengthen the workforce in Hawaii, develop energy managers and improve their skills set, and to offer attendees the opportunity to gain the Certified Energy Manager (CEM) certification designation, which fosters their professional development.

In PY13, Hawaii Energy offered one subsidized AEE Online Training Course, *Developing an Energy Management Master Plan*, as part of our support to the water and wastewater sector, while also evaluating the effectiveness of the online delivery method. The purpose of this course was to introduce the concept of energy management master planning to water and wastewater operators and managers. This online training offered flexibility for people who have a limited amount of time and could not be away from the office. Nine (9) professionals completed the course. Hawaii Energy received a number of emails thanking the Program for these great online courses.

This year, in addition to in-person trainings like the one above, Hawaii Energy and AEE offered an online training course designed especially for water and wastewater professionals.

Hawaii Energy also offered an in-person CEM Preparatory Seminar. The five-day program was a great success. There were a total of 39 unique registrants, from utility employees to state employees to military personnel. Of the 39 participants, 17 received CEM certification and three (3) received the Energy Manager in Training (EMIT) certification and will be eligible for a CEM certificate once they have achieved requisite experience. Positive comments and feedback from the participants suggested that the course was very well-received. Each participant checked “Yes” when asked if they would recommend this training to others. With the diverse origins of the participants, Hawaii Energy anticipates the skills gained in the training will result in effective efficiency efforts in a variety of end-users.

Building Operator Certification (BOC®) Workshops

University of Hawaii at Manoa Outreach College & Sustainable Living Institute of Maui (SLIM)

Hawaii Energy partnered with the University of Hawaii at Manoa Outreach College and SLIM to bring the nationally recognized energy efficiency training and certification program, Level 1 Building Operator Certifications (BOC®), to those working in commercial building operations and maintenance on Maui and Oahu. The training and certification program was a great opportunity for commercial businesses to improve energy efficiency in their processes in order save money and become more sustainable over the long term. BOC graduates also save money for commercial and institutional buildings by improving the energy efficiency of lighting, heating and cooling systems, and by enabling operators to be proactive in complying with environmental regulations affecting facility operations and maintenance.

» TRANSFORMATIONAL PROGRAM

Topics covered in the training included:

- a. Energy Efficient Operation of Building HVAC Systems
- b. Measuring and Benchmarking Energy Performance
- c. Efficient Lighting Fundamentals
- d. HVAC Controls Fundamentals
- e. Indoor Environmental Quality
- f. Common Opportunities for Low-Cost Operational Improvement
- g. Building Scoping for Operational Improvement

Three sets of BOC training and certifications were held in the Spring of PY13 – one (1) on Maui and two (2) on Oahu. Each BOC training consisted of eight (8) classes, which were covered within an eight (8) week period. For each participant, it was a total time commitment of about 74 hours, which included in-class exams and project assignments. Hawaii Energy provided funding for this training by heavily subsidizing the training costs to make it more affordable for qualified participants to attend. Qualified participants were defined as building engineers, HVAC technicians, electricians, maintenance workers, building managers and others involved in running or improving energy efficiency in a facility. As a result, a total of 51 participants received their Building Operator Certification.

Students in one of the Oahu BOC training sessions get familiar with some of the tools used in energy

Water and Wastewater Training and Best Practices Handbook Production

The water and wastewater initiative in PY13 focused on training and technical support in an effort to build momentum for energy efficiency in this sector. Hawaii Energy was very successful in engaging all the major water and wastewater operators on Oahu, Maui, and Hawaii Island. The Program provided energy and pump efficiency training for 124 operators and managers from the Honolulu Board of Water Supply (BWS), Oahu Environmental Services Wastewater division, Maui Department of Water Supply (DWS), and Maui County Environmental Management and Wastewater Reclamation Division. The Program also partnered with the Hawaii Commission on Water Resource Management to address water and wastewater operators on all islands about the importance of water loss control and the connection between water loss and wasted energy. On Maui, the Program produced and delivered a three-hour block of instruction for the SLIM-sponsored basic water and wastewater operator course given at UH Maui Campus. Despite continued engagement with Hawaii Island DWS and County of Hawaii Department of Environmental Management Wastewater Division the Program was unable to coordinate a training session in PY13. Training on Hawaii Island will remain a priority in PY14.

Most notably, Hawaii Energy produced and distributed the State's first "Water and Wastewater Energy Management Best Practices Handbook", which was developed with New York State Energy Research and Developmental Authority (NYSERDA) and Focus on Energy, Wisconsin's statewide energy efficiency and renewable resource program. The handbook is designed to assist operators, managers and financial decision-makers in making wise decisions with respect to energy efficiency within the water and wastewater sector. It includes industry-tested best practices and addresses benefits and limitations to each best practices and overall industry acceptance of the measures. The Handbook was completed towards the end of PY13 so distribution will continue into PY14.

» MARKETING & OUTREACH

In PY13, the focus of the Program's marketing, outreach and communications efforts was to continue to increase awareness of Hawaii Energy and evolve our strategic endeavors to ensure consistency in branding and messaging. Our goals for PY13 included: (1) provide more comprehensive and integrated marketing and communications support to our residential, business and transformational offers; (2) bring public relations services in-house to more effectively communicate our program's initiatives; and (3) expand advertising strategy to leverage brand awareness to drive participation.

Below are just some of the marketing and communications highlights from PY13:

Marketing, Advertising and Promotions

Email Marketing

In PY13, the Program developed and launched a consistent email marketing plan to complement our current marketing efforts. It was important for the Program to integrate email marketing into its overall marketing and communications strategy to extend our audience reach and increase awareness. The benefits of email marketing include the ability to: (1) provide real-time and personalized messages; (2) send targeted marketing campaigns to one of three subscriber lists (i.e., residential, business and energy professionals) and (3) communicate with electric ratepayers more frequently.

Our email marketing plan included:

- Development of distribution plans for email marketing targeting each audience in support of Residential, Business and Transformational program goals;
- Creation of e-newsletter templates (i.e., residential, business and energy professionals);
- Development of three subscriber lists; and
- Development and maintenance of our email database to have quality subscriber lists.

As a result of our email marketing efforts, some highlights included:

- Developing a list of over 10,000 engaged email subscribers who have all opted in to receive email communications from us.
- Distributing email marketing messages monthly either via our bi-monthly residential e-newsletter, quarterly business e-newsletter or specialized messages promoting Transformational and program-wide efforts.
- Achieving an average open rate of 37.32% and an average click-through rate of 10.39% across all 16 email messages sent in PY13. Based on industry standards, both are above average open and click-through rates and can be attributed to our commitment to providing engaging and relevant information, maintaining a quality email list as well as providing targeted messages to segmented recipients.

» MARKETING & OUTREACH

Advertising

Co-op Advertising

To extend the Program's residential solar water heating message and promote the instant \$1,000 rebate, a co-op advertising program was developed and piloted in 2nd quarter of PY13. Solar water heating participating contractors were eligible to receive advertising funds from the Program to help offset the cost of their company's advertising in print publications, radio and TV. To qualify for funding, their advertising must include Hawaii Energy's logo and messaging. Participating contractors were eligible for reimbursements up to 50% of the cost of their ad, not to exceed \$1,000 per program year per contractor.

Although only four (4) solar water heating companies participated in the co-op advertising program and received reimbursements, the Program received positive feedback from the contractors for this initiative. Many of the contractors expressed interested in this program, but due to varying factors like advertising budgets already being committed, were unable to take advantage of the offer. As such, we've decided to continue our co-op advertising program in PY14.

Solar Water Heating Ad Campaign

With the changes to the PV industry in the 2nd and 3rd quarter of PY13, it was an ideal time for the Program to further promote solar water heating.

The objectives for the PY13 advertising campaign, which ran for three months from March to May, were to:

- 1) Build on the brand equity from the PY12 ad campaign;
- 2) Increase awareness of the benefits of solar water heating;
- 3) Drive consumers online to learn how to get started as well as guide them through the purchasing process.

The advertising strategy was to continue with a mix of TV, online, radio and print advertising. As a part of the strategy, there was a more targeted focus on print and radio advertising on the neighbor islands since those mediums are primary sources for the community to get news. Overall, the portfolio of media purchased for this campaign yielded an estimated reach of 11.4 million, which helped to continue to convey our message and increase brand awareness. Reach is defined as the estimated number of readers or viewers reached in a given medium.

Sample advertisements from contractors who took advantage of the Hawaii Energy's Co-op Advertising offer.

» MARKETING & OUTREACH

The PY13 goal for solar water heating was to have 2,400 systems installed through the instant \$1,000 rebate. In the two program years since the advertising campaign has been running, the Program has seen an 80.2% increase in solar water heating authorizations from March through May, which has been the timeframe of our media buys (see **Figure 10** at left).

Some highlights from the advertising campaign include:

- Reaching approximately 269,000 unique Facebook users and delivering 869,000 impressions.
- Driving over 3,000 customers to the solar water heating landing page via the banner ad campaign on a variety of targeted websites.

Broadened Advertising Strategy

Since the inception of the Hawaii Energy program, the advertising strategy had been focused on promoting specific residential rebates and offers with a limited advertising run. In order to increase awareness of the Hawaii Energy brand, it was important to broaden our advertising strategy to be more consistent and continuous. In PY13, messaging was focused on the overall program and the variety of rebates it offers.

- **Hawaii Business Magazine:** Launched our “Energy Tip of the Month” column (right), a monthly advertisement designed to attract attention like an editorial in the front “Trending Now” section of the publication. The column promoted the Program and our various incentives and rebates. In addition, we had a 1/3 page monthly ad placed in the Small Business section that highlighted a company that received an incentive. *Hawaii Business Magazine* reaches 81,000 business-minded readers and decision-makers each month.
- **Green Hawaii: A 32-Page Guide to Living a Greener Life** produced by *Hawaii Home + Remodeling Magazine*: We sponsored and helped to develop this special publication, which provided readers with ways to save energy and money through energy conservation and efficiency. *Green Hawaii* reached 110,000 people and appeared in the April issue of *Hawaii Home + Remodeling Magazine*, May issue of *Honolulu Magazine* and June issue of *Hawaii Business Magazine*. Along with this special publication, *Hawaii Home + Remodeling Magazine* sent out a Hawaii Energy-focused e-newsletter to over 6,000 monthly subscribers in April and May 2014. The Program also received 10,000 copies for distribution at community outreach events.

SPECIAL PROMOTION

MAILE'S ENERGY TIP OF THE MONTH

Did you know?
Hawaii Energy is offering free energy-saving CFLs in exchange for old incandescent bulbs.

Hawaii Energy offers Oahu residents with a great opportunity to save energy by exchanging their old incandescent bulbs with compact fluorescent lamps (CFLs). Switching to energy-efficient CFLs can save you about \$15 per bulb annually on your electric bill.

We're inviting organizations on Oahu (including condo and homeowner associations) to host CFL exchange events for residents, employees and the community. Participating organizations will receive CFLs for free and 50¢ for each bulb exchanged.

In order to participate, you must:

- be an active organization, business or nonprofit; and
- conduct your own CFL exchange (get creative!).

In turn, we'll provide your organization with the CFLs in increments of 500, assist with marketing materials, and dispose of the incandescent bulbs.

For more information, visit hawaiienergy.com/cfl-exchange or contact Caroline Carl, Residential Program Manager at caroline.a.carl@hawaiienergy.com or (808) 839-8820.

Hawaii Energy
Hawaii's clean energy company

Hawaii Energy is the statewide leader in energy conservation and efficiency, working with the Hawaii State Office of Energy Conservation, Hawaii's Department of Energy, and the Hawaii Department of Public Works.

» MARKETING & OUTREACH

- KRTR 96.3 FM:** Launched radio advertising campaign with Summit Media Hawaii's KRTR 96.3 FM, which ran from April to June. This campaign included "Energy Saving Tips of the Day" spots during the afternoon drive time (3 - 8 p.m.), on-air DJ endorsements by Shawnee Hammer, monthly live radio interviews and placement of online ads on the KRTR website. KRTR is the top "at work" radio station on Oahu and reaches adults 25 - 54 years old and women 25 - 44 years old.

Direct Mail

Electric Bill Inserts

The Program designed inserts highlighting residential rebates (including CFLs and the Bounty offer) and business incentives. These inserts were included with the March and April bills for Hawaiian Electric, Hawaiian Electric Light Company and Maui Electric. The bill inserts reached 365,000 residential electric customers and 60,000 business electric customers per monthly insert.

Solar Water Heating Direct Mail

The Program developed and strategically distributed via mail a postcard-sized direct mail piece in May promoting residential solar water heating, its energy-saving benefits and the Hawaii Energy rebate to homeowners in Ewa Beach, Kapolei, Mililani and Waipahu with a household income of more than \$75,000. Those Oahu neighborhoods were specifically chosen due to high PV saturation in those areas. The direct mail reinforced the message of solar water heating as a first step towards energy savings before or in addition to PV. A total of 20,389 mailers were sent out and the program received a significant lift in traffic to our solar water heating website page in the four days after the distribution of the direct mailer. We received on average 107 visits per day, up from an average of 30. A vanity URL (hawaiienergy.com/solarsavings) was used on the direct mail piece, which enabled us to track interest and engagement. This was the first time the Program ever used a direct mail strategy to reach an audience and promote an offer.

REDUCE
Electricity Costs

&

BOOST
Your Bottom Line

**WITH ENERGY
EFFICIENCY
INCENTIVES**
for your business

No matter what type of business you operate, **Hawaii Energy**, the energy conservation and efficiency program, can help you take control of your electricity costs.

We provide cash incentives to Hawaii businesses for installing a wide variety of energy-efficient equipment and measures – ranging from lighting, air conditioning and building envelope improvements to submetering. We also offer customized rebates and technical assistance.

Investing in energy efficiency can reduce your energy and operational costs – and boost your bottom line. *Learn more today!*

Visit www.HawaiiEnergy.com/for-your-business or call us at (808) 839-8880 or toll-free at (877) 231-8222.

This three-panel direct mail piece was sent out in May 2014 as the last component to a program year-long push for the \$1,000 solar water heating rebate.

» MARKETING & OUTREACH

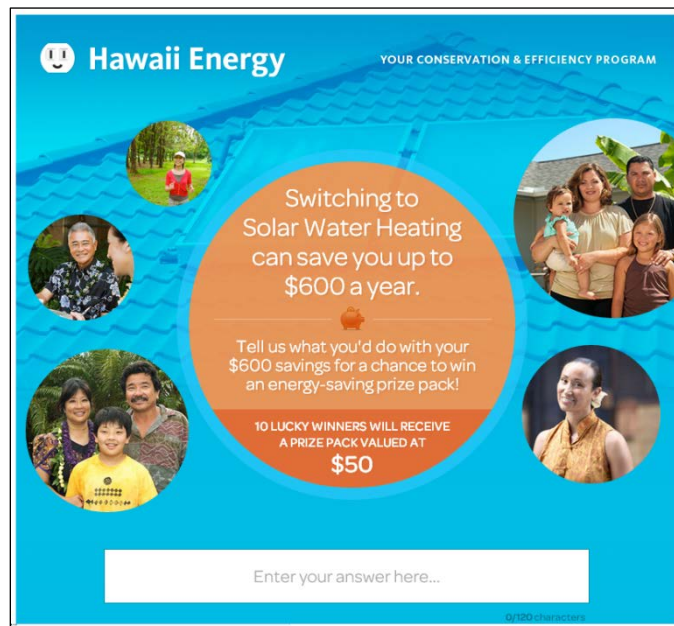

Social Media

Solar Water Heating Facebook Promotion

We wrapped up the Program's 10-week solar water heating Facebook promotion, which launched at the end of PY12. As a part of the promotion, Facebook users were asked to "like" the Hawaii Energy Facebook page and share how they would use the \$600 savings they would have received if they had installed a solar water heating system. Contestants entered to win an energy-saving gift pack (valued at \$50) and a winner was chosen weekly. This promotion substantially increased "likes" for the program Facebook page by over 50% with 1,171 likes. "Likes" are important in social media in that they indicate strong audience interest and engagement.

Energy-Saving Instagram Photo Contest

In PY13, we launched an Instagram account for Hawaii Energy. To increase our Instagram follows, we piloted the Program's first Instagram photo contest with the YMCA Healthy Kids Day event on April 12. Participants were asked to take a photo with one or more energy-saving devices displayed at the event and were eligible to win a gift basket. Ten (10) Instagram users entered the contest and we acquired 15 new followers. We later determined that there may have been more contest entries, but some contestants may not have made their Instagram newsfeed public, which resulted in us not being able to view their photos. The Program will continue to experiment with and refine social media engagement.

Our Solar Water Heating Facebook Contest (left) and Healthy Kids' Day Instagram Photo Contest (right) helped us further increase and engage with our social media following and build our e-newsletter subscription base.

» MARKETING & OUTREACH

Public Relations

Public relations is the management of relationships between an organization and its various stakeholders through strategic communications. Hawaii Energy's public relations efforts have resulted in the development of solid, working relationships with the local news media, which has resulted in positive media coverage for the Program.

Throughout PY13, Hawaii Energy continued to strategically identify and leverage media opportunities to amplify ratepayer's awareness of and participation in Hawaii Energy as a program, as well as specific residential and business offerings. Public relations continues to be a critical component to the Program's integrated marketing strategy in order to establish credibility and build awareness through the news media.

The marketing and communications team expanded in PY13 to include the hiring of a Public Relations Specialist. Since the inception of the Program in 2008, we retained local subcontractors for our public relations services. As the Program continued to grow, we determined it would be more efficient and effective to bring these services in-house.

Results

Hawaii Energy generated a plethora of media coverage that spanned all news mediums including television, radio, newspapers, magazines, websites and trade publications.

The estimated cumulative reach of media coverage was calculated by multiplying the circulation/audience figures of each medium by three, which is a generally-accepted calculation method within the public relations industry. Cumulative reach was estimated at more than 8,601,868.

The total Publicity Value (PV) of media coverage is estimated at \$237,770. Publicity Value is calculated by multiplying the Advertising Value Equivalency (AVE) by three, which is a factor generally accepted by the marketing industry. AVE is what the editorial coverage would cost if it were advertising space (print publications) or on-air time (television and radio).

Media Coverage Highlights

Generated media coverage is highlighted below and divided into categories. To read full stories secured throughout the year, please refer to the media coverage report in Attachment F.

Press Conference

On September 19, 2013, Hawaii Energy orchestrated a press conference with the Hawaii National Guard in recognition of their commitment to energy conservation and efficiency. The Hawaii National Guard completed a pilot program designed to reduce energy consumption. These programs and behavior modifications throughout the National Guard's 20-plus facilities, resulted in approximately 7% overall energy reduction with some of its facilities seeing up to a 23% reduction. Governor Abercrombie and Major General Darryll Wong of the Hawaii National Guard attended and spoke at the press conference.

» MARKETING & OUTREACH

In PY12, Hawaii Energy sponsored a command-wide training program to introduce energy conservation practices and energy audit guidelines to approximately 132 National Guard staff. In turn, these staff members applied the training to the facilities where they worked and shared their knowledge with other facility occupants. Hawaii Energy provided the training in collaboration with Smart Sustainability Consulting, a Honolulu-based company, which specialized in occupant engagement through the identification and education of wasteful lighting and air conditioning practices with the goal of adopting institutional behavior change.

Several energy-saving opportunities were identified by the energy audits performed as part of the training. These ranged from space consolidation or optimization to no- and low-cost operational changes to large-scale capital improvement projects.

From January to March 2013, the National Guard worked on four energy efficiency retrofit projects that were estimated to save more than 257,000 kilowatt hours (kWh) per year the equivalent to more than \$79,000 in electricity cost per year based on \$0.31 per kWh (average kWh rate in 2012). Hawaii Energy presented a check for \$21,361 in incentives to the National Guard for its various energy-saving initiatives.

These initiatives and energy efficiency measures included the following:

- *Interior De-Lamping* – Removed 1,195 fluorescent lamps throughout eight (8) facilities in excessively lit areas.
- *LED Retrofit* – Replaced 20 Metal Halide and 12 High Pressure Sodium exterior lamps with energy-efficient, UL qualified LEDs, which reduced energy consumption by 70 percent in Buildings 306/306a.
- *Water-Cooled Chiller & Variable Frequency Drive (VFD) Pumps* – Replaced existing A/C system with an energy-efficient, water-cooled chiller and added VFD technology to pumps and motors. Current data forecasts savings of 75,600 kWh per year in Buildings 306/306a.
- *Implementation of a Commander-Supported Energy Conservation Awareness Program* – The program encouraged all facility occupants to take personal responsibility for energy conservation in their workspace. This measure alone was estimated to have added greatly to the overall energy reduction realized throughout all facilities.

Stories about the press conference appeared on Hawaii News Now's evening newscast (CBS and NBC affiliate in Hawaii), its website HawaiiNewsNow.com and sister station website KFVE.com. Hawaii's ABC affiliate also pursued a story that aired on KITV News as well as the *Honolulu Star-Advertiser* (print and online).

Program Director Ray Starling addresses the attendees at a press conference announcing the Hawaii National Guard's energy-saving initiatives in September 2014.

» MARKETING & OUTREACH

Seasonal Stories

Hawaii Energy created additional opportunities to keep the importance of energy conservation and efficiency top-of-mind by developing seasonal stories ideas during Christmas and Earth Day.

Green Leaf Blog (*Honolulu Star-Advertiser*) pursued our story ideas about how to save energy during Christmas that included purchasing LED Christmas lights, keeping ovens and refrigerators closed and washing full loads of laundry when families visit. A similar story was also featured in Hawaiian Properties' monthly newsletter that was written for property managers at various condos around Oahu. Hawaii Energy also developed energy-saving tips geared toward families and children that appeared in *Maui Family Magazine*.

During Earth Day (April 22, 2014), Hawaii Energy was a guest on KHON's morning show "Wake Up 2Day", which featured low-cost tips to reduce energy consumption with conserve switches, smart strips and plug-in energy monitors as well as the importance of solar water heating.

Energy-Saving Offers

Throughout PY13, the marketing and communications team turned each new or updated residential and business offer into an opportunity to be featured in the news. The process involved working closely with the residential and business teams to identify details of the offer, as well as its energy savings potential and cost benefits. In addition, to better prepare Hawaii Energy's call centers, the team developed frequently asked questions (FAQs) documents about these various offers.

To saturate awareness, our public relations efforts resulted in stories in various newspapers, trade publications, online news websites, blogs and radio interviews. Below is a sampling and brief description of the different offers and key media coverage.

Bounty Increase – Hawaii Energy doubled the rebate for its recycling program on Oahu to \$50, giving added incentive to recycle their extra working refrigerators or freezers.

- Green Leaf Blog (*Honolulu Star-Advertiser*) – Double Rates for Rid-A-Fridge"
- *Pacific Business News* – "Hawaii Energy Doubles Rebate for Old Refrigerators"

Solar Water Heater Tune-Up – Residents had the limited-time opportunity to receive a \$150 rebate for a "tune-up" or maintenance on their solar water heaters to check for wear and tear that could include leaks, corrosion or timer malfunction.

Marketing Manager Maile Alsop represented Hawaii Energy on KHON2's morning show, "WakeUp2Day" to provide energy-saving tips in conjunction with Earth Day.

- *West Hawaii Today* – “Program Replaces Inefficient Lighting for Small Businesses”

Check Presentations

Hawaii Energy recognized and promoted businesses’ energy-saving projects and their financial incentives received from the Program. There were a total of 11 check presentations with business ratepayers from various industries that included hotels, packaging companies and convenience stores/gas stations.

The company’s executive teams and contractors that worked on the projects were invited for a photo opportunity on property. In turn, Hawaii Energy secured news coverage and photo placements in several media outlets.

» MARKETING & OUTREACH

Aloha Petroleum – The largest independent gasoline marketer and one of the biggest convenience store operators in Hawaii, received a \$41,352 incentive for installing energy-efficient lighting at 17 of its gas stations on Oahu. The estimated annual savings toward electricity costs was \$88,920.

- *Green Magazine* (Online Edition) – “Hawaii Energy Presents Check to Aloha Petroleum”
- *Pacific Business News* – “Aloha Petroleum Receives Incentive Check From Hawaii Energy”
- Petrolworld.com – “Aloha Petroleum Gets Incentives for Energy Efficiency”

Courtyard Marriott Waikiki Beach – The hotel received an incentive of more than \$119,000 for installing an energy-efficient air conditioning system and LEDs. The hotel was projected to save approximately \$190,000 a year on electricity costs.

- *Associated Press* – “Saving Energy Wins Waikiki Hotel More Than \$119,000”
 - Picked up by HawaiiNewsNow.com, KFVE.com, Renewable Energy News, Seattle Post-Intelligencer
- *Hawaii News Now* (5 a.m. newscast)
- *Maui News* (Business/In Brief section)
- *Pacific Business News* – “Courtyard By Marriott Waikiki Beach Gets Money Back for Saving Energy”
- *West Hawaii Today* – “Saving Energy Wins Hotel More Than \$119k”

Grand Wailea – The hotel installed new variable frequency drives and pump equipment designed to seamlessly adjust the water flow for its Wailea Canyon Activity Pool that included nine separate pools and various waterslides, white water rapids, whirlpool and the world’s first “water elevator.” The financial incentive was \$202,048. The estimated annual cost savings toward electricity was \$380,028.

- *Maui News* – “Grand Wailea Rewarded for its Energy Efficiency Efforts”
- *Maui TV News* – “Resort Receives ‘Grand’ Energy Incentive”

Hawaii Prince Hotel Waikiki and Golf Club – The 541-room hotel received a \$150,000 incentive for upgrading its air conditioning system by replacing three old chillers with energy-efficient enhanced chillers for the entire property. The estimated annual energy savings was \$288,000.

- *Green Magazine* (Online Edition) – “Hawaii Energy Presents \$150,000 Incentive Check to the Hawaii Prince Hotel Waikiki and Golf Club for a New Energy-Efficient Air Conditioning System”

Pacific Beach Hotel received the largest hotel incentive in Hawaii Energy history – \$308,145 for air conditioning system upgrades and the installation of an energy management system. They are estimated to save \$280,000 per year in electricity costs.

» MARKETING & OUTREACH

- *Pacific Business News* – “Hawaii Energy Gives \$150,000 to Hawaii Prince Hotel Waikiki for Upgrading AC System”

Pacific Allied Products – Incentive for \$91,484 to a Kapolei-based plastics manufacturing company for installing a high-speed bottle blower to inflate plastic bottles that captures and recycles excess air to help save electricity. The estimated annual energy savings was \$148,000.

- *Midweek* (Print & Online Editions) – “Hawaii Energy Supports Pacific Allied Products”

Pacific Beach Hotel – Received the largest incentive check of any hotel since inception of the Hawaii Energy program at \$308,145 for air conditioning system upgrades and for the installation of an energy management system. The estimated annual electricity cost savings was \$280,000.

- *Hotel Business* – “Pacific Beach Hotel Earns \$308K for Energy Program”
- *Pacific Business News* – “Pacific Beach Hotel Gets Largest Energy Incentive Check of Any Hawaii Hotel”

Public Relations Support of Transformational Offers

The marketing and communications team amplified awareness about a transformational offering for energy professionals called “Creating Value with Energy Efficiency Spring Workshop Series.” The five-day workshop was conducted by a nationally-recognized energy efficiency expert named Mark Jewell and designed specifically for industry professionals (i.e., electrical contractors, architects, engineers) and vendors responsible for pursuing expense-reducing capital projects. Media coverage included a guest interview on Hawaii Public Radio’s popular talk show “The Conversation” that aired during the morning drive-time hours. Additional media coverage included an online story in the *Pacific Business News*.

Another transformational offering that the marketing and communications team helped promote were the NEED (National Energy Education Development) Project workshops. These free workshops held on Hawaii Island, Molokai and Oahu were aimed at educating teachers about how to teach energy efficiency to Kindergarten to 12th grade students. Teachers received training, curriculum materials, energy kits (valued between \$300 and \$400) to use with their students and were eligible to apply for Hawaii Energy Education Grants up to \$2,500 and a scholarship to attend NEED’s annual National Energy Conference for Educators. In order to secure attendance, flyers were distributed through schools, social media content was developed and calendar listings were secured in *Midweek*. There was also post media coverage about one of the workshops held in Kaneohe featured in *Midweek’s* community newspaper called *Midweek Islander*.

» MARKETING & OUTREACH

Case Studies

In order to show the benefits of Hawaii Energy and the incentives we offer, we began developing case studies on businesses who have successfully worked with the Program. These case studies enable us to showcase the details of their energy-saving projects and how energy efficiency has benefitted their business or organization. The case studies will be able to be used as a tool for our business specialists to provide to potential participants. Two (2) case studies were completed in PY13, which featured Chaminade University (right) and If the Shoe Fits, a small business direct install lighting participant. We will continue our case study development in PY14.

Weekly Online Talk Show

Hawaii Energy continued its sponsorship of the “Hawaii: The State of Clean Energy” online talk show produced and hosted by Jay Fidell of ThinkTech Hawaii. Hawaii Energy was featured each week during a 5-minute segment called the “Negawatt Moment with Hawaii Energy.” The show was streamed live on Ustream.com on Wednesdays from 4 to 5 p.m. and re-aired on community access television station *Olelo*. Links to the archived shows, which appear on several different website including YouTube and Vimeo, can be found on the ThinkTech Hawaii website.

The talk show served as a forum for Hawaii Energy’s staff to bring awareness to the latest residential, business and transformational rebates and incentives as well as practical energy conservation tips. The marketing and communications team conducted media training and developed talking points to prepare staff members for each interview.

LED LIGHTING HELPS ENSURE CAMPUS SAFETY AT CHAMINADE UNIVERSITY OF HONOLULU

Chaminade University of Honolulu

"Chaminade is committed to reducing energy consumption and its carbon footprint."
— Ramon Lopez, Facilities Office Manager
Chaminade University of Honolulu

When Chaminade University decided to upgrade their campus lighting, LED fixtures were the obvious choice. Not only would energy-saving LEDs help to reduce operational costs and lower their environmental impact, but most importantly, they would improve lighting conditions on the campus. The white light emitted by LEDs would provide better viewing conditions at night, greatly improving details on their security feeds.

Chaminade is working in phases to complete an energy-efficient retrofit on all of their exterior lighting throughout its 65-acre campus, which is shared with St. Louis School and the Marist Center of Hawaii. 77 old, inefficient lamps, including fluorescent and high-intensity discharge (HID) light bulbs, were replaced with new LEDs. With their exterior lighting on 12 hours a day, every day, this retrofit not only reduced their lighting usage by 73%, but is estimated to save the campus \$6,380 a year.

In addition, the retrofit was implemented by in-house staff at Chaminade, which significantly reduced installation costs, and thanks to the improved lighting performance, the campus exterior is now safer and more secure at night for students, faculty and administration.

► \$3,700 incentive from Hawaii Energy!
► 23,344 kWh savings annually
► 22 tons of CO₂ saved annually
► \$6,380 annual energy cost savings

To save energy and money on your electric bill, visit www.HawaiiEnergy.com or call 808-888-8888.

ABOUT THE PROPERTY

- Established in 1955
- University campus
- 3,800 students

FINANCIAL ANALYSIS

- Project investment cost: \$20,000
- Cash incentive for LEDs: \$3,700
- Single payback with incentive: 1.4 years
- Project energy savings at net present value: 10x/yr

PROJECT BENEFITS

- Exterior lighting energy reduced by 73%
- Maintenance costs lowered from replacing burnt-out lamps over next 10 years
- Improved lighting performance
- Safety and security increased through enhanced light levels and replacement of incandescent lights

EQUIPMENT

- 77 new, energy-efficient lamps and fixtures replaced fluorescent and HID light bulbs
- Five-year warranty on LEDs
- Expected life greater than 10 years

“Sharing The Aloha” workshop facilitator Helen Wai made her first appearance on the “Hawaii: The State of Clean Energy” show this year, accompanied by Hawaii Energy team members Derrick Sonoda and Ray Starling.

>> MARKETING & OUTREACH

Outreach

For PY13, the Program continued to build on its overall goals of: (1) partnering with local businesses and nonprofit organizations to further our conservation messaging efforts; (2) increasing our presence and participation at local events and expos in order to broaden our audience reach and (3) continuing to present our Program to a variety of organizations and groups.

Event Participation and Presentations

Throughout its fifth year, Hawaii Energy built upon a strong foundation of successful outreach events and explored several opportunities to reach new audiences and introduce our expanded offerings.

The Program’s goal for community outreach event participation has always been to: (1) reach a wide-array of electric ratepayers; (2) to continue involvement in past outreach events that were deemed successful and (3) to find and participate in new outreach events. Community outreach participation is defined as the Program having a booth or table at an expo, conference, tradeshow, fair or festival and distributing Program-related information and giveaways. This program year, Hawaii Energy participated in 38 community outreach events with an estimated total attendance of 117,636 people. Of these events, 79% of them were in Honolulu County, 8% in Hawaii County and 13% in Maui County.

Several new events were added in PY13 in an effort to reach a wider audience. These included the Pacific Building Trade Expo, “Science Alive!” at the Bishop Museum and the Earth Day Festival at the University of Hawaii at Manoa.

In March and April, the Program also participated in three “open house” events hosted by Hawaiian Electric Company (HECO) in Pearl City, Moanalua and Kaimuki where HECO planned to pilot smart meters. Hawaii Energy staffed informational tables to engage attendees interested in energy conservation and efficiency.

In March, Hawaii Energy and Leidos Engineering, LLC jointly supported along with other sponsors the first-ever “Electric Utilities of the Future” conference hosted by the Maui Economic Development Board. The event brought together energy experts, business leaders and policymakers from across the nation and state to discuss Hawaii’s progress towards clean energy.

In addition to community outreach event participation, the Program conducted 22 presentations to a variety of organizations providing information on Hawaii Energy, residential rebates and business incentives. Of these presentations, 9% were in Hawaii County, 77% in Honolulu County and 14% in Maui County. We were able to reach approximately 1,011 people through these efforts.

Partnerships

Honolulu Board of Water Supply

Hawaii Energy partnered once again with the Honolulu Board of Water Supply (BWS) to sponsor their annual Water Conservation Week Poster and Poetry Contests. This year's theme, "Conserve Water: No Effort is Too Small," invited Oahu students to consider how small conservation efforts can impact the overall preservation of our water supply, especially combined with other actions. More than 1,300 posters and 200 poems were submitted to the annual contests and the winners were selected based on the accuracy of information, originality, creativity and artistic or poetic ability, based on the student's age to convey the theme. 42 Oahu students from kindergarten to 12th grade were recognized and presented with awards at a ceremony held at the City and County of Honolulu's Mission Memorial Auditorium. Hawaii Energy was also included in all public relations efforts and the calendar that will highlight all of the winners and submissions for the poster and poetry contest.

Hawaii Energy sponsored the Honolulu Board of Water Supply's Water Conservation Week Poster & Poetry Contest and attended the awards ceremony in May.

"Rid-A-Fridge to Fight Hunger" Benefitting Food banks

The Program enhanced its "Bounty" refrigerator/freezer recycling offer this year by rolling out a campaign titled "Rid-A-Fridge to Fight Hunger." Residents who participated in the Bounty offer were given the option to donate the amount of their rebate (\$50 on Oahu, \$65 on neighbor islands) to their local food banks – Hawaii Foodbank on Oahu, Maui Food Bank on Maui and The Food Basket on Hawaii Island. Through this collaboration with the food banks, Hawaii Energy was able to refresh excitement for the Bounty offer and raise over \$3,000 collectively for all three nonprofits.

In addition to adding this option to the standard rebate form, Hawaii Energy implemented extensive PR and marketing efforts through pre-existing distribution channels (e.g., radio spots, a press release, campaign-specific collateral distributed by refrigerator recyclers, posts to social media accounts, etc.) to ensure the most cost-effective promotion. Public relations coverage included a guest interview on Hawaii's most-watched television morning show, *Sunrise*, on Hawaii News Now, and stories in *Pacific Business News*, *Maui News* and *West Hawaii Today*.

A flyer for the "Rid-A-Fridge to Fight Hunger" campaign. The top section features a logo with a recycling symbol and a plus sign, with the text "RID-A-FRIDGE to Fight Hunger". Below this, a statistic states: "14% of Hawaii residents are in need of emergency food assistance, including young children and the elderly." The middle section is titled "You can help." and describes the program: "Starting this October, when you recycle a refrigerator or freezer through Hawaii Energy's Bounty Program, you can donate your rebate to the Hawaii Foodbank. You'll save about \$275* on your electric bill annually, while your \$25 rebate provides food for 60 meals for those in need. Together, we can make a difference for the more than 183,000 people who face hunger in Hawaii." It also mentions that participation is easy by checking the "I'd like to make a difference" box on the rebate application. The bottom section includes the Hawaii Energy logo and the Hawaii Food Bank logo, along with a small photo of a person recycling a refrigerator. Fine print at the bottom states: "Hawaii Energy is a ratepayer-funded conservation and efficiency program administered by Lexion Engineering, LLC (formerly SAIC) under contract with the Hawaii Public Utilities Commission serving the islands of Hawaii, Lanai, Maui, Molokai and Oahu." and "Actual savings vary. Estimate as of September 2013."

This flyer was distributed to local refrigerator recyclers, who helped encourage donations to the food banks as they picked up old refrigerators.

» MARKETING & OUTREACH

“Hui Up!”

Hawaii Energy continued its efforts to strengthen the community by working with Blue Planet Foundation to help Molokai residents lower the cost of their electric bills through a refrigerator exchange program called, “Hui Up!.” The program offered residents to exchange their old refrigerators for energy-efficient models for just \$250, which also included free pick-up and recycling of the old refrigerator and delivery of the new one.

Blue Planet and Hawaii Energy set up an information booth in Kaunakakai, the heart of the island, to speak with residents and encourage participation in the program. In addition, Blue Planet and Hawaii Energy went door-to-door to a handful of homes to interview residents and capture video footage to provide television stations for potential media coverage.

Hui Up! helped 220 households on Molokai purchase new energy-efficient refrigerators that were estimated to each save about \$500 in electricity costs annually. Hawaii Energy secured television morning appearances on KITV News and KHON News (Fox affiliate). Print media coverage included the *Molokai Dispatch* and *Pacific Business News*.

As part of the Hui Up program, Hawaii Energy staff went to Molokai to assist residents with their refrigerator exchanges and provide information about other Hawaii Energy rebates.

» KEY REPORTING ASSUMPTIONS

Technical Resource Manual (TRM)

All energy efficiency and conservation programs need to estimate the average amount of energy and demand that is saved for installations of standard measures. This allows an effective program to promote these standard measures across markets with an incentive amount that is appropriate for the amount of energy and/or demand that is typically saved. Hawaii Energy maintains these energy saving estimates in the Technical Resource Manual (TRM). The following describes how the TRM was developed and the key assumptions that were used in estimating the energy (kWh) savings and demand (kW) reduction impacts claimed by the Program. Changes are made from time to time at the recommendations of the Program Evaluator. Upon the end of each program year, a formal evaluation is conducted by the Program Evaluator whereby updates are implemented for the subsequent program year.

The TRM is intended to be a flexible and living document. New measures may be added as new program designs are implemented. These measures are often not yet characterized, so new information will be gathered through evaluations or research. Savings for current measures may change as the market evolves.

There are four main reasons to update TRM values:

- **New Measure Additions** – As new technologies become cost-effective, they will be characterized and added to the manual. In addition, new program delivery design may result in the need for new measure characterization.
- **Existing Measure Updates** – Updates will be required for a number of reasons; examples include: increase in the federal standard for efficiency of a measure; new information from field tests; altered qualification criteria; decrease in measure cost; or a new evaluation that provides a better value of an assumption for a variable. As programs mature, characterizations need to be updated to meet the changes in the market.
- **Retiring Existing Measures** – When the economics of a measure become such that it is no longer cost-effective or the free-rider rate is so high that it is not worth supporting, the measure shall be retired.
- **Third-Party Measurement and Verification (M&V) Contractor TRM Review** – Annually the M&V contractor will provide a review of the current TRM and make recommendations based on current market research and in-field savings verification of measures.

Description of the TRM

The TRM provides methods, formulas and default assumptions for estimating energy and peak demand impacts for measures and projects that receive financial incentives from Hawaii Energy. It is organized by program, end use and measure. It describes how the Program estimates energy savings from each measure. The PY13 TRM represents a total of 73 measures for both residential and commercial programs and is shown as Attachment E.

>> KEY REPORTING ASSUMPTIONS

Overview of the TRM Derivation

In the TRM, each measure includes a description of the typical baseline (average) energy use and the high efficiency energy use for that type of technology. The energy saved is typically the differential between the two. The energy use of the baseline technology may include some estimation of market status related to various types of older, less efficient equipment. The final savings values are compared against the previous evaluation studies performed for the Hawaiian Electric Companies' programs, as described in this report.

Data assumptions are based on Hawaii specific data, when and where available. Where Hawaii data was not available, data from neighboring regions is used where available and in some cases, engineering judgment is applied. Referenced data sources, in general order of preference, but not necessarily limited to, include:

- Energy and Peak Demand Impact Evaluation Report of the 2005-2007 Demand Management Programs – KEMA
- HECO IRP-4: Energy Efficiency Potential Study (HECO DSM Docket)
- 2004 – 2005 Database for Energy Efficiency Resources (CA DEER database)
- 2007 – 2008 Database for Energy Efficiency Resources (CA DEER database) Update
- Other Energy Efficiency Program Design Information (e.g. Efficiency Maine, Focus on Energy, etc.)
- CEUS – The California Commercial Building End-Use Survey
- Evergreen TRM Review/Report dated 6/20/13
- Evergreen – Third Party Evaluation NTG Recommendation Memo January 2013
- ENERGY STAR® Partner Resources
- Field verification of measure performance

The savings estimates for each measure were initially drawn from the KEMA Evaluation Report for 2005 through 2007 since this report was the most recent information available on specific markets. The values in this report were built upon previous evaluation reports and in-field measurements.

Since there were many measures that used “average” field measured data and no mathematical savings derivations, the calculation approach in the TRM attempted to develop these savings calculations based on typical measure characteristics. The primary use of the KEMA report values was to guide market assumptions, especially for the baseline energy use, to more accurately estimate the typical savings.

Customer level savings are based on many variables including: measure life, market sectors, base versus enhanced case, persistence and coincidence factors. Claimed savings were compared against other sources, such as savings values used in other jurisdictions and research documentation from KEMA, the American Society of Heating, Refrigeration and Air-Conditioning Engineers (ASHRAE), the National Renewable Energy Laboratory (NREL) and other organizations.

» KEY REPORTING ASSUMPTIONS

Factors Determining Program Level Savings

Application of System Loss Factors

The amount of energy saved at a customer site is not equal to the amount saved at the electric utility plant supplying the energy to that site. There are system losses in generation, transmission and distribution of energy from the power plant to the site. This results in a larger savings at the power plant than at the customer site. To account for this larger impact on the system the “system loss factor” needs to be estimated. The system loss factors were provided by HECO, MECO and HELCO. They do not vary by measure, but by island, and are listed in **Table 75**.

| Table 75 System Loss Factors | | |
|---|-------|--------|
| County System to Customer Energy Loss Factors | | |
| Oahu | Maui | Hawaii |
| 11.17% | 9.96% | 9.00% |

The system loss factors were applied to the estimated Customer Level savings for each measure to calculate the impact on the system of a particular measure. The resulting System Level savings was used to estimate the overall impact to the reduced cost of not producing the saved energy. This “avoided cost” is the overall economic benefit and used within one of the primary cost benefit measures for the Program, called a Total Resource Cost (TRC) test.

Net-to-Gross Ratio

The Net-to-Gross (NTG) Ratio is used to adjust the System Level Energy savings to determine the energy saving that is attributed to the Program, or “Program Level Savings.”

Program Level Savings are those directly attributed to Hawaii Energy actions by separating out the impacts that are a result of other influences, such as consumer self-motivation or free-riders. Free-riders are ratepayers or participants who received an incentive and/or education by the Program, but the incentive and/or education did not play a role in their decision to purchase or receive the savings measure.

| Table 76 Net-To-Gross Factors | | |
|----------------------------------|--|-------------|
| Program | Description | NTG |
| BEEM | Business Energy Efficiency Measures | 0.75 |
| CBEEM | Custom Business Energy Efficiency Measures | 0.75 |
| BESM | Business Services and Maintenance | 0.95 |
| BHTR | Business Hard-to-Reach | 0.99 |
| REEM | Residential Energy Efficiency Measures | 0.79 |
| CESH | Custom Energy Solutions for the Home | 0.65 |
| RESM | Residential Services and Maintenance | 0.92 |
| RHTR | Residential Hard-to-Reach | 1.00 |
| Composite NTG Ratio | | 0.78 |

New Program Net-to-Gross Values

The Third-Party Evaluator recommendations for Net-to-Gross values were adopted for the development of the PY13 Annual Plan and were based on verified PY12 results. These values recognize the differences in Program-driven savings between the various categories of measures. The evaluation can be found at www.hawaienergy.com/information-reports. Hawaii Energy utilizes the combined Program total NTG ratio of 78%. The values used in PY13 are provided in **Table 76**.

>> KEY REPORTING ASSUMPTIONS

Development of Avoided Costs

As described above, the primary overall economic benefit for the State is the avoided cost for the energy that is saved. The total avoided cost of all the energy that is saved is called the Total Resource Benefit (TRB). To estimate the TRB for individual measures or for the total savings for the Program, the cost per MWh supplied and the system capacity cost per kW need to be estimated into the future.

Proxy Avoided Cost Developed

The avoided cost that is used for PY13 is estimated using an extrapolation of the avoided energy data provided by HECO. The energy and capacity cost data from the first few years was then extrapolated over 20 years. **Table 77** shows this extrapolation. This table was deemed a reasonable estimate of actual avoided energy and capacity costs as it was more in line with the avoided costs used in many other programs. Therefore, these avoided costs were used to calculate the TRB (Total Resource Benefit).

| Table 77 Utility Avoided Cost | | | | |
|----------------------------------|--------------|----------------|----------------------|------------|
| | | Discount Rate | | |
| | | 6% | Utility Avoided Cost | |
| Year | Measure Life | NPV Multiplier | \$/kW/yr. | \$/kWh/yr. |
| 2013 | 1 | 1 | 353.2 | 0.104 |
| 2014 | 2 | 0.94 | 370.6 | 0.109 |
| 2015 | 3 | 0.89 | 382.5 | 0.112 |
| 2016 | 4 | 0.84 | 386.2 | 0.113 |
| 2017 | 5 | 0.79 | 387.7 | 0.114 |
| 2018 | 6 | 0.75 | 389.1 | 0.114 |
| 2019 | 7 | 0.7 | 391.9 | 0.115 |
| 2020 | 8 | 0.67 | 390.7 | 0.115 |
| 2021 | 9 | 0.63 | 394.6 | 0.116 |
| 2022 | 10 | 0.59 | 398.3 | 0.117 |
| 2023 | 11 | 0.56 | 397.4 | 0.117 |
| 2024 | 12 | 0.53 | 401.4 | 0.118 |
| 2025 | 13 | 0.5 | 405.7 | 0.119 |
| 2026 | 14 | 0.47 | 409.3 | 0.120 |
| 2027 | 15 | 0.44 | 415.9 | 0.122 |
| 2028 | 16 | 0.42 | 423.3 | 0.124 |
| 2029 | 17 | 0.39 | 428.9 | 0.126 |
| 2030 | 18 | 0.37 | 433.9 | 0.128 |
| 2031 | 19 | 0.35 | 438.9 | 0.13 |
| 2032 | 20 | 0.33 | 443.9 | 0.132 |

>> CONCLUSION

As we conclude this PY13 Annual Report, the Hawaii Energy team would like to thank the PUC and the people of Hawaii for the opportunity and privilege to serve as your Public Benefits Fee Administrator over the past five years. We especially appreciate the confidence you have placed in us by extending our contract for a third additional year (through 2016) and directing that we expand the range of energy services being performed under the contract. This will allow us to make an even stronger contribution to Hawaii's clean energy efforts.

We also want to thank the PUC staff, our Contract Manager, subcontractors, allies, friends and constituents for all the support you have provided to help us develop the Program to this point of evolution. The Hawaii Energy Team is proud to have this unique opportunity to work with all of you in making such important advances in Hawaii's quest for long term sustainability.

As we begin our new program year, the Hawaii Energy Team pledges to continue our best efforts to serve the people of Hawaii and accelerate Hawaii's progress towards a 100% clean energy economy.

>>ATTACHMENTS

Attachment A: Acronym List

A list of the commonly used Hawaii Energy acronyms

Attachment B: PY13 Program Participation List

A report of Program impacts by program and measure, including gross, net, annualized and lifecycle savings.

Attachment C: PY13 Contract Renewal Proposal (Attachment S1A from Supplemental Contract No. 5)

The Performance Incentive Mechanism from the original PBFA contract is superseded by this Renewal Proposal (submitted May 1, 2013), which covers the changes implemented in Program Year 2013.

Attachment D: PY13 Annual Plan

The Program's annual plan, which provides Leidos' strategies and plans for administration and delivery of the Hawaii Energy portfolio for PY12 (July 1, 2012 to June 30, 2013). Through this plan, Hawaii Energy set forth overall strategies to increase program participation, maximize energy savings, and encourage the development of energy efficiency materials.

Attachment E: PY13 Technical Reference Manual

The Program's reference manual, which provides methods, formulas, and default assumptions for estimating energy and peak impacts of incentivized projects and measures. The reference manual is organized by program, end use and measure.

Attachment F: PY13 Media Coverage Report

The media coverage report contains highlights of print and online media coverage, which ranged from general population publications to localized media.

Attachment G: Program Historical Summary (2009 - 2012)

A summary of the Program's implementation methods, achievements, significant events and lessons learned for each year since the Program's inception.

Attachment H: Program, Customer and System Benefits Chart

A chart comparing the Program's kWh benefits and cost effectiveness at the Program, Customer and System levels.

RE: Proposal for Supplemental Contract Terms Modifying the March 3, 2009 Hawaii Energy Efficiency Program Contract for the Period July 1, 2013 – June 30, 2014 ("Renewal Proposal")

On behalf of **Science Applications International Corporation, R.W. Beck and SAIC Energy, Environment, and Infrastructure, LLC** ("SAIC" or "Contractor"), and in response to the February 28, 2013 PBFA Contract Renewal Guidelines for Year 5 (PY2013) from James Flanagan Associates regarding guidelines for the Renewal Proposal ("Renewal Guidelines") at Appendix A, we are pleased to present SAIC's Renewal Proposal for modification of certain terms of the March 3, 2009 Hawaii Energy Efficiency Program Contract ("Program Contract") that will cover the period July 1, 2013 – June 30, 2014 ("Contract Renewal" or "Supplemental Contract"):

1. PY2013 PROPOSAL EXECUTIVE SUMMARY

Pursuant to a competitive bidding process, the Hawaii Energy Efficiency Program Contract was signed by the State of Hawaii and SAIC on March 3, 2009 ("Program Contract" or "Contract"). Under this Program Contract, SAIC assumed the new statutory role of Public Benefits Fee Administrator ("PBFA") for the state under the direct supervision and control of the Hawaii Public Utility Commission ("PUC" or "Commission") and the Contract Manager, James Flanagan Associates ("JFA"). The term of the Program Contract runs until December 31, 2013, with the possibility of a no-bid 3-year extension thereafter at the discretion of the Commission.

In its capacity as PBFA, SAIC also took over operations of the utility energy efficiency and demand-side management (DSM) programs operated by the Hawaiian Electric Companies on the islands of Oahu, Molokai, Lanai, Maui and Hawaii. Under SAIC as PBFA, the efficiency and DSM programs are now operated as *Hawaii Energy Conservation and Efficiency Programs* ("Hawaii Energy" or "Program").

The original Program Contract provided an operating budget and performance incentive goals for the first two program years running from July 1, 2009 to June 30, 2010 (PY2009) and from July 1, 2010 to June 30, 2011 (PY2010). However, the Contract left open to later negotiation the budgets and performance incentive goals for the remaining years under the Contract, as well as other related Contract terms as needed. This Renewal Proposal is intended to add to and/or modify the budget, performance incentive goals and other related Contract terms as needed for PY2013. The detailed Annual Plan for PY2013 which is derived from parameters established in this Renewal Proposal will be published not later than June 1, 2013 after approval by the PUC.

This Renewal Proposal does not include the budget or terms of an additional Scope of Work for development and administration of an On-Bill Financing (OBF) Program that will be added separately to the Program Contract.

2. SUMMARY BUDGET AND BUDGET BREAKOUT NUMBERS

Table 1 below shows a summary of the Program Budget and budget breakout numbers for PY2013 that result from the assumptions made in this Renewal Proposal. The detailed Program Budget and Impacts for July 1, 2013 – June 30, 2014 will be included in the Annual Plan for PY2013.

Table 1: Summary Budget

PROGRAM BUDGET GUIDELINES

PBFA Contract Renewal Guidelines for Year 5

| | |
|------------------------|-------------------|
| Program Year | 2013 |
| Period of Performance | 7/1/13 to 6/30/14 |
| PBFA Budget Allocation | \$ 33,616,031.00 |

| Budget Item / Category | Amount | % of Total Budget | % of Subtotal |
|--|--------------|-------------------|---------------|
| General Administrative and IT Costs | \$ 2,190,479 | 6.5% | 94% |
| Performance Award in Excess of Target* | \$ 133,000 | 0.4% | 6% |
| Total PBFA Administrative Costs | \$ 2,323,479 | 6.9% | 100% |

| Budget Item / Category | Total | Allocation Targets | |
|--------------------------------|--------------------|--------------------|-----------------------|
| | | Direct Incentives | Direct Implementation |
| | 100% | 70.0% | 30.0% |
| Residential Program Cost Split | 45% \$ 14,081,648 | \$ 9,857,154 | \$ 4,224,494 |
| Business Program Cost Split | 55% \$ 17,210,904 | \$ 12,047,633 | \$ 5,163,271 |
| Total Direct Program Costs | 100% \$ 31,292,552 | \$ 21,904,787 | \$ 9,387,765 |

| Budget Item / Category | Direct Incentives | Res + Bus Incentives |
|---------------------------------|----------------------|----------------------|
| Residential Direct Incentives | 40.5% \$ 8,871,439 | 90% |
| Business Direct Incentives | 49.5% \$ 10,842,869 | \$ 19,714,308 |
| Transformational Incentives | 10.0% \$ 2,190,479 | |
| Total Program Direct Incentives | 100.0% \$ 21,904,787 | |

Proposed Incentives and Operations Breakouts

| Budget Item / Category | Amount | % of Total Budget | % of Subtotal |
|-------------------------------------|------------------|-------------------|---------------|
| Residential Incentives | \$ 8,871,439.00 | 26% | 40.5% |
| Business Incentives | \$ 10,842,869.00 | 32% | 49.5% |
| Transformation Incentives | \$ 2,190,479.00 | 7% | 10.0% |
| Total Incentives | \$ 21,904,787.00 | 65% | 100.0% |
| Administration / IT | \$ 2,190,479.00 | 7% | 19% |
| Direct Program Implementation Costs | \$ 9,387,765.00 | 28% | 81% |
| Total Operations | \$ 11,578,244.00 | 34% | 100% |
| Total Incentives | \$ 21,904,787.00 | 65% | 65% |
| Total Operations | \$ 11,578,244.00 | 34% | 34% |
| Total Award in Excess of Target* | \$ 133,000.00 | 0% | 0% |
| Total Budget | \$ 33,616,031.00 | 100% | 100% |

* = This Incentive Award budget amount is not earned until performance is achieved.

These highlighted figures are key program metric percentages

3. SUMMARY IMPACT RESULTS EXPECTED FROM THIS RENEWAL PROPOSAL

Table 2 below shows a summary of savings impacts for PY2013 based on the proposed budget presented in Table 1. The detailed Program Budget and Impacts for July 1, 2013 – June 30, 2014 will be included in the Annual Plan for PY2013 to be published NLT June 1, 2013.

Table 2: Cost Effectiveness and Benefit Targets

| Hawaii Energy - PY2013 ANNUAL PLAN | |
|--|---|
| PROGRAM COST EFFECTIVENESS AND BENEFIT TARGETS | |
| PROGRAM GUIDELINES (PROPOSED) | |
| PBFA Contract Renewal Guidelines for Year 5 (PROPOSED) | |
| Total Program Direct Incentives | \$ 19,714,308 |
| First Year Energy Reduction | 141,616,143 kWh - Program Level |
| Peak Demand Reduction | 17,821 kW on Peak 5 to 9 p.m. Weekdays |
| Total Resource Benefit | \$ 177,013,974 NPV of Utility Cost Avoidance Attributed to the PBFA |
| Derived Top Down Cost Effectiveness Metrics | |

4. PROPOSED PY2013 PERFORMANCE GOALS

The chart below shows **SAIC's Proposed Performance Goals** for PY2013 using the assumptions as referenced in this Renewal Proposal.

| PY2013 Proposed Performance Goals | | | | | |
|-----------------------------------|-------------------|----------------|----------------|--------------|--|
| Performance Target Item | Performance Goals | | | | |
| | Minimum | Target | Maximum | | |
| | 75% | 100% | 110% | | |
| First Year Energy Reduction | 106,212,107 | 141,616,143 | 155,777,757 | kWh | |
| Peak Demand Reduction | 13,366 | 17,821 | 19,603 | kW | |
| Total Resource Benefit | \$ 132,760,481 | \$ 177,013,974 | \$ 194,715,371 | \$ | |
| Transformation | | | | | |
| Infrastructure Development | | | | | |
| Behavior Modification | 13,500 | 18,000 | | | |
| Professional Development | 750 | 1,000 | | | |
| Technical "Know How" | 1,500 | 2,000 | | | |
| Island Incentive Equity | | | | | |
| | Minimum | Target | Maximum | Contribution | |
| | 80% | 100% | | | |
| County of Hawaii | \$ 1,987,202 | \$ 2,484,003 | n/a | 12.6% | |
| C&C Honolulu | \$ 11,733,956 | \$ 14,667,445 | n/a | 74.4% | |
| County of Maui | \$ 2,050,288 | \$ 2,562,860 | n/a | 13.0% | |
| Total | | \$ 19,714,308 | | 100.0% | |

5. PROPOSED PY2013 PERFORMANCE INCENTIVES

The chart below shows **SAIC's Proposed Performance Incentives** for PY2013 using the revised assumptions as referenced in this Renewal Proposal in conjunction with a continuation of the \$700,000 per year payment holdback for performance incentives as provided for in the original 2009 Program Contract.

| PY2013 Performance Incentives | | | | |
|--|-------------|-------------------------|------------|------------|
| Performance Target Item | % of Target | Program Incentive Award | | |
| | | Minimum | Target | Maximum |
| | | 75% | 100% | 123.8% |
| First Year Energy Reduction | 35% | \$ 183,750 | \$ 245,000 | \$ 303,188 |
| Peak Demand Reduction | 5% | \$ 26,250 | \$ 35,000 | \$ 43,313 |
| Total Resource Benefit | 40% | \$ 210,000 | \$ 280,000 | \$ 346,500 |
| Infrastructure development | 10% | n/a | \$ 70,000 | \$ 70,000 |
| Island Incentive Equity | 10% | n/a | \$ 70,000 | \$ 70,000 |
| Total | | | \$ 700,000 | \$ 833,000 |
| Potential Award for Performance in Excess of Targets | | | | \$ 133,000 |

| PY2013 Transformational Program Goals/Incentives | Minimum Participation | Minimum Award | Target Participation | Target Award |
|--|-----------------------|---------------|----------------------|-----------------|
| Behavior Modification | 13,500 | \$17,500 | 18,000 | \$23,334 |
| Professional Development | 750 | \$17,500 | 1,000 | \$23,333 |
| Technical "Know How" | 1,500 | \$17,500 | 2,000 | \$23,333 |
| | | | Target Award | \$70,000 |

6. SIGNIFICANT INCREASE IN TARGETED COST EFFECTIVENESS

As presented in Table 3 below, the PY2013 Renewal Guidelines present a significant increase in the targeted demand (+31%) and energy values (+54%) between PY12 and PY13 Targets. The Renewal Guidelines were formulated based on evaluated performance of PY2011. This program year exceeded expectations and came in under budget for numerous reasons as described in the following section. These circumstances are highly unlikely to be met again for PY2013, however, the target goals as proposed in Table 2 exceed goals for PY2011 and PY2012 by 23% and 18% respectively.

Table 3: Renewal Guidelines Relative to Past Performance

| Program Year | Total Budget | Transformational Budget | Incentive Budget | Demand | Total Cost per kW | First Year Energy | First Year Total Cost per kWh |
|---------------|---------------|-------------------------|------------------|--------|-------------------|-------------------|-------------------------------|
| PY11 Target | \$ 32,271,390 | \$ 2,194,455 | \$ 19,974,424 | 16,401 | \$ 1,968 | 108,500,425 | \$ 0.297 |
| PY12 Target | \$ 34,960,672 | \$ 2,377,326 | \$ 21,637,050 | 17,916 | \$ 1,951 | 115,588,084 | \$ 0.302 |
| PY13 Target | \$ 33,616,031 | \$ 2,190,479 | \$ 19,714,308 | 23,604 | \$ 1,424 | 178,403,201 | \$ 0.188 |
| PY13 vs. PY12 | -3.8% | -7.9% | -8.9% | 31.7% | -27.0% | 54.3% | -37.7% |

| | Average Measure Life | Lifetime Energy | Lifetime Total Cost per kWh |
|---------------|----------------------|-----------------|-----------------------------|
| PY11 Target | 8.0 | 868,003,400 | \$ 0.037 |
| PY12 Target | 8.0 | 924,704,672 | \$ 0.038 |
| PY13 Target | 7.7 | 1,373,704,648 | \$ 0.024 |
| PY13 vs. PY12 | -3.8% | 48.6% | -35.3% |

| Program Year | Actual / Proposed Expenditures | CFL Count | CFL Energy Contribution | Actual Demand | Total Cost per kW | First Year Energy | First Year Total Cost per kWh |
|---------------|--------------------------------|-----------|-------------------------|---------------|-------------------|-------------------|-------------------------------|
| PY11 Actual | \$ 25,741,826 | 1,923,077 | 66,683,669 | 17,260 | \$ 1,491 | 128,785,968 | \$ 0.200 |
| PY13 Proposed | \$ 33,616,031 | 1,516,100 | 50,913,130 | 17,821 | \$ 1,886 | 141,616,143 | \$ 0.237 |
| PY13 vs. PY11 | 30.6% | -21.2% | -23.6% | 3.3% | | 10.0% | 18.8% |

| | Average Measure Life | Lifetime Energy | Lifetime Total Cost per kWh |
|---------------|----------------------|-----------------|-----------------------------|
| PY11 Actual | 8.5 | 1,094,680,728 | \$ 0.024 |
| PY13 Proposed | 8.0 | 1,132,929,144 | \$ 0.030 |
| PY13 vs. PY11 | -5.9% | 3.5% | 26.2% |

Lifetime Total Program Cost PY11 Same as Target for PY12

7. UNUSUALLY HIGH PY2011 PERFORMANCE

There are a few items that cause the PY11 actual performance values not to be transferable to PY13. These actions/measures are:

- ***PY13 Significant Reduction in Program Reliance on CFLs***
 - 53% in PY11 to 39% of Program kWh in PY13
 - 1,923,077 lamps to 1,516,100 lamps
- ***Small Business Direct Installation Program that did not exist in PY11***
 - This program is large >\$1.5M in PY13 and was over \$2M in PY12.
 - The cost per kWh is running at \$0.75 per kWh.
- ***Lower potential for CO Garage Projects that drove cost effective and multi-million kWh/year savings in PY11.***
 - PY12 reduced the incentive levels and capped the payment to 85% of project cost and stalled participation.
 - This level of opportunity is no longer as cost effectively available as the big hitters were captured in the first two years of the measure offer.
- ***Implementation of central plant metering and direct program site review and analysis assistance to targeted project development of large savings opportunities***
 - Central Plant Benchmarking of SWAC Office Buildings and Kona Coast Hotels to get kW/ton metering and commissioning/capital project justification based on the data.
 - Water and Wastewater program to provide metering for pump optimization, time-of-use, and demand response opportunities.
- ***Reduced Reliance on CFLs*** – It is recognized that CFLs are “mainstream” and that the program has steadily moved away from a reliance on this “one-trick” pony. The market still responds to low-cost subsidized CFLs, and there was concern last year that the rare-earth phosphor pricing was going to drive CFL prices up last year. This did not happen to the extent predicted and the CFL sales remained steady though at a lower level than PY11 which was a high year with a large push for the technology as well as grants that provide lamps for free for hard-to-reach customers.
 - PY13 proposed measure mix reduces the CFL contribution from 53% of first year energy to 39%. This is a 21% reduction from 1,841,842 lamps in PY11 to a total of 1,516,100 lamps in PY13 with a 9% increase in per kWh cost effectiveness.
 - The Program will maintain current level of reliance on CFLs in order to come close to the achieving aggressive savings targets.
 - Hawaii Energy will continue to closely work with the retailers and manufacturers to drive the incentive levels to the minimum required to maintain the conversion rates as the prices of the technology and education measures drive demand for the lamps. The preliminary results of the end-use survey work have identified many “sockets” still occupied by incandescent lights demonstrating the need to continue the education and support to achieve deeper penetration of the technology as LEDs come to the market and become the cost-effective technology.

8. PROPOSAL TECHNICAL DETAILS

- i) *Continued Emphasis on Total Resource Benefit (TRB) Target* - The trend of Hawaii Energy's plan is the continued emphasis towards investments with longer term savings. The target goals provided reflect this emphasis by weighting and targeting an aggressive Total Resource Benefit (TRB) target.

The targeted average measure life of 7.7 years is required to meet the assigned energy, demand and TRB goals. In reality the program is populated with measure lives that are bifurcated by the "Average" life with CFLs at 5 year lives and contributing tremendous savings, while longer life 14-20 year T8, Solar and AC projects provide long-lasting though smaller overall savings to the program at far higher acquisition costs.

- ii) *New Program Net-to-Gross Values* – The Third-Party Evaluator recommendations for Net-to-Gross values were adopted in the development of the PY13 Annual Plan. These values recognize the differences in program driven savings between the various categories of measures. This method was used prior to the PBFA and is being reinstated with updated information to justify the values. The values used are:

| New Net-to-Gross Factors | | |
|---|--|--------------|
| Program | | Net-to-Gross |
| BEEM | Business Energy Efficiency Measures | 0.75 |
| CBEEM | Custom Business Energy Efficiency Measures | 0.75 |
| BESM | Business Services and Maintenance | 0.95 |
| BHTR | Business Hard to Reach | 0.99 |
| REEM | Residential Energy Efficiency Measures | 0.79 |
| CESH | Custom Energy Solutions for the Home | 0.65 |
| RESM | Residential Services and Maintenance | 0.92 |
| RHTR | Residential Hard to Reach | 1.00 |
| Effective Program Total Based on PY11 Portfolio Performance | | 0.78 |

- iii) *Large Committed Projects* – There are several committed large business projects that were driven with the higher incentives and committed in PY12 that need to be accommodated in the PY13 budget. These projects drive the target cost-effectiveness required for the remainder of the business and residential measures to attempt to achieve the targeted energy savings goals.

The projects of significant note adding up to 40% of the PY13 budget plan are:

| Major Committed Projects | Incentive | 1st Year Energy | Life | Lifetime Energy | Net-to-Gross |
|--|--------------|-----------------|------|-----------------|--------------|
| Waste Water UV Treatment Lighting | \$ 3,200,000 | 18,929,700 | 15 | 283,945,500 | 99% |
| Shopping Center Parking Exterior Lighting | \$ 320,000 | 1,660,500 | 12 | 19,926,000 | 75% |
| Military Existing Home Solar Water Heating | \$ 800,000 | 1,372,237 | 20 | 27,444,740 | 75% |
| Major Committed Projects Total | \$ 4,320,000 | 21,962,437 | 15 | 331,316,240 | |
| % of Business Totals | 40% | 30% | | 35% | |
| Cost per kWh | | \$ 0.197 | | \$ 0.013 | |

- iv) *Small Business Direct Installation – Lighting (SBDIL)* – This program will be modified to eliminate full project cost incentives for Standard T8 to Low-wattage T8 and return them back to the standard prescriptive incentive levels. This move will markedly increase the cost effectiveness and drive the focus on businesses that for whatever the circumstances have not been able to get the T12s out of their facilities. The T12 to T8 retrofits will continue at full value incentives as well as ENERGY STAR® LED/CFL and LED Case lighting.

This action will help drive the cost effectiveness from \$0.75/kWh (PY12 realized value) for all business types to \$0.57 for Restaurants (better due to normally longer operating hours) and \$0.46 for all Small Businesses.

The budget will be dropped from \$2.7M to \$1.25M to meet the targeted program goals. There are currently six more contractors coming on-line, so this will pose a challenge to keep all interested with meaningful or desirable work driven by the program. There is also a refining of the Memorandum of Understanding (MOU), to strengthen oversight and monitoring metrics to address lessons learned in the first full year of implementing the SBDIL program.

| Small Business Lighting - Direct Install | Incentive | 1st Year Energy | Life | Lifetime Energy | Net-to-Gross |
|--|--------------|-----------------|------|-----------------|--------------|
| SBDIL Small Business | \$ 750,000 | 1,314,563 | 14 | 18,403,882 | 105% |
| SBDIL Restaurant | \$ 500,000 | 1,095,930 | 14 | 15,343,020 | 105% |
| SBDIL Totals | \$ 1,250,000 | 2,410,493 | | 33,746,902 | |
| % of Business Totals | 12% | 3% | | 4% | |
| Cost per kWh | | \$ 0.519 | | \$ 0.037 | |
| Major Committed Projects Total | \$ 4,320,000 | 21,962,437 | | 331,316,240 | |
| SBDIL Totals | \$ 1,250,000 | 2,410,493 | | 33,746,902 | |
| Major Committed and SBDIL Total | \$ 5,570,000 | 24,372,930 | 15 | 365,063,142 | |
| | 51% | 34% | | 38% | |

- v) *Increased Transformational Program* – During PY11 and PY12, the Program demonstrated the value of Transformational Program activities. The Program will continue to expand on these efforts as proposed in this Plan. These activities include education, training and other similar transformational activities that may not result in immediate quantifiable energy savings, but are likely to contribute to energy savings over time.
- vi) *Equity Among Rate Classes and Among Islands* – In PY13, the Program will continue to expand its efforts to bring Program benefits to small businesses, landlord-tenant situations and other hard-to-reach (HTR) customers. Additionally, the Program will review available mechanisms that promote Island Equity and implement pilot programs where feasible to test for the best equity enhancers for each island's particular circumstances.
- vii) *Reemphasis on Energy Usage Evaluation & Customer Targeted Offerings* – The Program has found that the use of evaluated and peer compared monthly energy data is a good tool to target and engage interest and participation in energy conservation and efficiency efforts. This provides customers with valuable information about their energy usage, and feedback on prior actions taken that can be used to justify projects to owners and get approval of energy efficiency actions. The Program will expand the effort to automate and make the program more widely available as well as use the peer comparisons and benchmarking to promote the best-of-the-best operational awards. The Program will also utilize time-of-use data, energy use benchmarking, and opportunity screening for in depth review of energy usage patterns to identify savings opportunities.
- viii) *Turn-Key and Direct Install Programs*– The Program demonstrated success in procuring turn-key programs and services from specialty vendors, including OPOWER peer comparison in PY10/11/12 and NEED.org teaching modules PY11/12. These turn-key programs have proven to be cost effective methods to secure highly skilled, top-notch services that the Program will continue into PY13. The following are examples of programs to be continued for PY13:
- Educational and Training – Programs to drive capabilities for the Building Operators and decision makers such as Building Operator Certification (BOC) training, International Facility Management Association (IFMA) local technical training seminars, Association of Energy Engineers (AEE) certification classes and testing for Certified Energy Managers (CEM) and Certified Energy Auditor (CEA), Energy Efficiency Funding Group (EEFG) Selling Energy Efficiency seminars.
 - Small Business and Residential Direct Install Measures – Direct install and audit services from small local energy firms and community-based service organizations to provide energy audit and retrofits will expand beyond lighting.
 - Restaurant Exhaust Fan Demand Ventilation Control – Direct install of exhaust fan demand ventilation control for small restaurants.
 - Central Plant Benchmark Metering – Installation of plant kW per ton metering to assist in developing peer group comparison of plant efficiencies as well as to aid customer commissioning efforts and the evaluation of the sea water air conditioning development.

- ix) *Attention on Island Equity* – The Program has addressed the County of Hawaii's concerns that its ratepayers paying into the Public Benefits Fund have not historically received their share of the Program's incentives. In PY12, the Program developed and implemented a direct-install Solar Water Heating installation offering for hard-to-reach households in Hawaii County, which exceeded the Program's island equity contribution to the county.

The Program will continue to expand its outreach, education and training for both Maui and Hawaii counties and continue with direct-install efforts for small businesses and residents with enhanced solar and other targeted special incentive initiatives.

- x) *Increasing Program Name Recognition* – It is recognized that there is a need for sustained emphasis on advertising, marketing and public relations to increase the brand name recognition. Advertising has been modest, but has been able to show increased Program exposure and recognition. Increased brand recognition will help the Program attract all potential customers and avoid any potential losses due to consumer confusion as to what entity to contact for incentives. In conjunction with this, the Program will continue to expand and upgrade the Program website to increase ease of use and encourage greater participation. The Program will explore methods to measure the effectiveness of advertising and other marketing efforts where possible to ensure funds are used efficiently.
- xi) *Proposed New Avoided Cost Table for TRB* – Hawaii Energy will work with the Contract Manager and the Energy Efficiency Portfolio Standards (EEPS) Avoided Cost Subcommittee to determine proposed updated Utility Avoided Cost figures.

These new values will be used to determine new TRB values that are more reflective of the current benefits to the Utilities and passed on to their customers.

The new HECO IRP information just released this year and the historical monthly avoided cost numbers provided by the HECO companies will be used to determine the new values.

It is understood that the TRB goals will need to be adjusted when the new avoided costs are agreed upon.

9. PROPOSED TRANSFORMATIONAL PROGRAM INITIATIVES

Below are the three broad areas of Transformation Program initiatives proposed for PY2013. The Transformation Goals will be measured by the total number of operational contacts made in each of these areas during the year.

Behavior Modification

- Continue the "Sharing the Aloha" workshops with the residential sector and introduce a similar workshop for the small business sector;
- Introduce In-Home Energy Mentoring targeting hard-to-reach households; leveraging non-profits and interns for delivery;
- Launch conservation and efficiency lessons content through online channels; focus is socially, culturally and economically-relevant messaging that will resonate with local communities;
- Develop efficiency and conservation training workshops for business to deliver "in house" workshops by and for employees.

Professional Development

- Continue to provide teachers with energy literacy training; create teacher advisory group for Hawaii Energy to better engage teachers, administrators and the Hawaii Department of Education such that trained teachers can integrate energy-related curriculum into current standards and classroom time.
- Underwrite internship opportunities for nearly or recently graduated college students interested in a "green" career. Support will provide internships that provide experience in both residential and business sectors. Hawaii Energy will also support the University of Hawaii system as it develops a facility management degree program.
- Continue workforce development workshops targeting those already in the energy field and those professionals who are involved in the decision-making process for businesses to invest in energy efficiency and conservation projects.

Technical "Know How"

- Support professional trade organizations that provide technical training to existing workforce (i.e. IFMA, AEE, ASHRAE) and reduce the barriers to participation through limited sponsorship;
- Support programs and certifications offered through the University of Hawaii system (i.e. Building Operator Certification) and reduce the barriers to participation;
- Enhance the skills of local trade and professional services firms by offering training workshops in the latest technology by technical subject matter experts from around the United States.

10. **ADDITIONAL NEW CONTRACT RENEWAL TERMS SUBMITTED IN THIS RENEWAL PROPOSAL**

In addition to the forgoing, SAIC proposes that:

1. The Quarterly Reports required under the original 2009 Contract be dispensed with as they have proven to be unnecessarily duplicative and thus wasteful of time and ratepayer money.
2. The PUC exercise its authority under the 2009 Contract to extend the term of the Contract beyond December 31, 2013.
3. The PUC allow SAIC to move budget funds as needed within broad budget categories with approval of the Contract Manager as long as Residential and Business funds are not mixed, incentive funds are not used for non-incentive purposes and the 10% statutory limit on administrative costs is not violated.
4. The PUC add to the 2009 Contract the additional Scope of Work and budget proposed by SAIC under separate cover for the PUC's On-Bill Financing Program.
5. All other Contract Terms and Conditions not specifically referenced in this Proposal be left as they currently are under the 2009 Contract as amended.

SAIC and the Hawaii Energy Team appreciate the opportunity to make this proposal and advance energy conservation and efficiency efforts in Hawaii.

H. Ray Starling, Hawaii Energy Program Director
SAIC Energy, Environment, and Infrastructure, LLC

1.0 INTRODUCTION

On behalf of **SAIC, Energy Environment, & Infrastructure , LLC (“SAIC”)** as the Hawaii Public Benefits Fee Administrator (PBFA), the PBFA’s proposed Annual Plan for Program Year 2013 (PY13), July 1, 2013 – June 30, 2014, is presented below.

1.1 Annual Plan

This Annual Plan (“Plan”) provides new strategies and a roadmap for administration and delivery of the Hawaii Energy *Conservation and Efficiency Program*. This Plan is for the fifth year of the Hawaii Energy Program and, therefore, will build upon the successes and lessons learned during the last four years.

With this new Plan, the PBFA will continue evolution of our overall strategies to increase program participation, maximize cost-effective energy savings, reduce dependence on imported fossil fuel and encourage expansion of energy efficiency, conservation and renewable energy measures throughout the islands.

As with last year, the PBFA will also continue to promote the Program’s focus on individual behavior change, personal energy awareness and group cultural change regarding energy use and sustainability in Hawaii.

As the Program leveraged the increased budget last year there were significant advancements in targeted hands-on assistance to major sources of future energy savings for the State. These efforts provided energy metering and system reviews for targeted large usage customers.

As the Program Year evolves and these and other factors reveal their true impacts on the Program, the PBFA will revise efforts for the benefit of the overall Program goals, with the concurrence of the Contract Manager.

1.2 Key Factors Impacting and Actions Basis for Annual Plan

The following are some of the key factors and actions that have impacted the Annual Plan developed for PY13.

- 1.2.1 *Required Increase in Targeted Cost Effectiveness* – The increase in the targeted demand (+8%) and energy values (+20%) between PY12 and PY13 Targets drives the program decisions to a great extent putting pressure on lowering incentive levels and limiting the higher cost to serve “investment” such as benchmark metering efforts that do not immediately result in first year savings for the program.

- ***PY13 Significant Reduction in Program Reliance on CFLs***
 - 53% in PY11 to 39% of Program kWh in PY13
 - 1,923,077 lamps to 1,516,100 lamps
- ***Small Business Direct Installation Program (SBDIL)***
 - First Year for SBDIL \$2.45M in PY12.
 - The PY12 cost per kWh is running at \$0.59 per kWh

| PY12 YTD | kWh Program | Incentive | Count | Cost per kWh |
|------------|-------------|--------------|-------|--------------|
| Business | 3,294,910 | \$ 2,127,117 | 2,290 | \$ 0.65 |
| Restaurant | 827,912 | \$ 325,746 | 394 | \$ 0.39 |
| SBDIL | 4,122,821 | \$ 2,452,862 | 2,684 | \$ 0.59 |

- To meet the portfolio budget this program will be:
 1. made smaller \$1.3M in PY13
 2. remove T8 to LWT8s as a full cost incentive measure
 3. Targeting Cost Effectiveness of \$0.52/kWh for PY13
- ***CO Garage Projects used to drive cost effective savings***
 - PY12 reduced the incentive levels from \$0.18 to \$0.14 this being the customer level portfolio average cost per kWh and capped the payment to 85% of project cost. This stalled participation.
 - For PY13 the program will adjust the level again to \$0.12 per kWh and remove the project cost limit.

- **Continue to support central plant metering and direct program site review and analysis assistance to targeted project development of large savings opportunities**

- The program will limit the addition of new sites and concentrate on the analysis and use of the existing 13 metering sites of SWAC Office Buildings and Kona Coast Hotels to utilize the kW/ton metering and commissioning for capital project justification based on the data.
- Water and Wastewater program to provide metering for pump optimization, time-of-use, and demand response opportunities.

1.2.2 **Reduced Reliance on CFLs** – It is recognized that CFLs are “mainstream” and that the program has steadily moved away from a reliance on this “one-trick” pony. The market still responds to low-cost subsidized CFLs, and there was concern last year that the rare-earth phosphor pricing was going to drive CFL prices up last year. This did not happen to the extent predicted and the CFL sales remained steady though at a lower level than PY11 which was a high year with a large push for the technology as well as grants that provide lamps for free for hard-to-reach customers.

PY13 proposed measure mix reduces the CFL energy contribution to the portfolio from 53% of first year energy to 39%. This is a 21% reduction from 1,923,077 lamps in PY11 to a total of 1,516,100 lamps in PY13 with a 9% increase in per kWh cost effectiveness.

| CFL PY11 | Residential | Business | Total | % of Portfolio |
|----------------|--------------|------------|--------------|----------------|
| Incentive | \$ 2,078,768 | \$ 124,733 | \$ 2,203,501 | 8.6% |
| Count | 1,841,842 | 81,235 | 1,923,077 | |
| \$/kWh | \$ 0.039 | \$ 0.010 | \$ 0.033 | |
| kWh First Year | 53,790,929 | 12,892,740 | 66,683,669 | 52% |
| kW | 7,419 | 1,661 | 9,080 | 53% |

| CFL PY13 | Residential | Business | Total | % of Portfolio | CFL Contribution Reduction |
|----------------|--------------|-----------|--------------|----------------|----------------------------------|
| Incentive | \$ 1,500,000 | \$ 32,200 | \$ 1,532,200 | 4.6% | \$ (671,301) Incentive -30% |
| Count | 1,500,000 | 16,100 | 1,516,100 | | (406,977) Count -21% |
| \$/kWh | \$ 0.032 | \$ 0.010 | \$ 0.030 | | \$ (0.003) \$/kWh -9% |
| kWh First Year | 47,618,159 | 3,294,972 | 50,913,130 | 36% | (15,770,539) kWh First Year -24% |
| kW | 6,559 | 388 | 6,947 | 39% | (2,133) kW -23% |

The Program will maintain current level of reliance on CFLs in order to come close to the achieving aggressive savings targets.

Hawaii Energy will continue to closely work with the retailers and manufacturers to drive the incentive levels to the minimum required to maintain the conversion rates as the prices of the technology and education measures drive demand for the lamps. The preliminary results of the end-use survey work have identified many “sockets” still occupied by incandescent lights demonstrating the need to continue the education and support to achieve deeper penetration of the technology as LEDs come to the market and become the cost-effective technology.

- 1.2.3 *Continued Emphasis on Total Resource Benefit (TRB) Target* - The trend of Hawaii Energy's plan is the continued emphasis towards investments with longer term savings. The target goals provided reflect this emphasis by weighting and targeting an aggressive Total Resource Benefit (TRB) target.

The targeted average measure life of 7.7 years is required to meet the assigned energy, demand and TRB goals. In reality the program is populated with measure lives that are bifurcated by the "Average" life with CFLs at 5 year lives and contributing tremendous savings, while longer life 14-20 year T8, Solar and AC projects provide long-lasting though smaller overall savings to the program at far higher acquisition costs.

- 1.2.4 *New Program Net-to-Gross Values* – The Third-Party Evaluator recommendations for Net-to-Gross values were adopted in the development of the PY13 Annual Plan. These values recognize the differences in program driven savings between the various categories of measures. This method was used prior to the PBFA and is being reinstated with updated information to justify the values. The values used are:

| New Net-to-Gross Factors | | |
|---|--|--------------|
| Program | | Net-to-Gross |
| BEEM | Business Energy Efficiency Measures | 0.75 |
| CBEEM | Custom Business Energy Efficiency Measures | 0.75 |
| BESM | Business Services and Maintenance | 0.95 |
| BHTR | Business Hard to Reach | 0.99 |
| REEM | Residential Energy Efficiency Measures | 0.79 |
| CESH | Custom Energy Solutions for the Home | 0.65 |
| RESM | Residential Services and Maintenance | 0.92 |
| RHTR | Residential Hard to Reach | 1.00 |
| Effective Program Total Based on PY11 Portfolio Performance | | 0.78 |

- 1.2.5 *Large Committed Projects* – There are several committed large business projects that were driven with the higher incentives and committed in PY12 that need to be accommodated in the PY13 budget. These projects drive the target cost-effectiveness required for the remainder of the business and residential measures to attempt to achieve the targeted energy savings goals.

The projects of significant note adding up to 40% of the PY13 budget plan are:

| Major Committed Projects | Incentive | 1st Year Energy | Life | Lifetime Energy | Net-to-Gross |
|--|--------------|-----------------|------|-----------------|--------------|
| Waste Water UV Treatment Lighting | \$ 3,200,000 | 18,929,700 | 15 | 283,945,500 | 99% |
| Shopping Center Parking Exterior Lighting | \$ 320,000 | 1,660,500 | 12 | 19,926,000 | 75% |
| Military Existing Home Solar Water Heating | \$ 800,000 | 1,372,237 | 20 | 27,444,740 | 75% |
| Major Committed Projects Total | \$ 4,320,000 | 21,962,437 | 15 | 331,316,240 | |
| % of Business Totals | 40% | 30% | | 35% | |
| Cost per kWh | | \$ 0.197 | | \$ 0.013 | |

- 1.2.6 *Small Business Direct Installation – Lighting (SBDIL)* – This program will be modified to eliminate full project cost incentives for Standard T8 to Low-wattage T8 and return them back to the standard prescriptive incentive levels. This move will markedly increase the cost effectiveness and drive the focus on businesses that for whatever the circumstances have not been able to get the T12s out of their facilities. The T12 to T8 retrofits will continue at full value incentives as well as ENERGY STAR® LED/CFL and LED Case lighting.

This action will help drive the cost effectiveness from \$0.75/kWh (PY12 realized value) for all business types to \$0.57 for Restaurants (better due to normally longer operating hours) and \$0.46 for all Small Businesses.

The budget will be dropped from \$2.7M to \$1.25M to meet the targeted program goals. There are currently six more contractors coming on-line, so this will pose a challenge to keep all interested with meaningful or desirable work driven by the program. There is also a refining of the Memorandum of Understanding (MOU), to strengthen oversight and monitoring metrics to address lessons learned in the first full year of implementing the SBDIL program.

| Small Business Lighting - Direct Install | Incentive | 1st Year Energy | Life | Lifetime Energy | Net-to-Gross |
|--|--------------|-----------------|------|-----------------|--------------|
| SBDIL Small Business | \$ 750,000 | 1,314,563 | 14 | 18,403,882 | 105% |
| SBDIL Restaurant | \$ 500,000 | 1,095,930 | 14 | 15,343,020 | 105% |
| SBDIL Totals | \$ 1,250,000 | 2,410,493 | | 33,746,902 | |
| % of Business Totals | 12% | 3% | | 4% | |
| Cost per kWh | | \$ 0.519 | | \$ 0.037 | |
| Major Committed Projects Total | \$ 4,320,000 | 21,962,437 | | 331,316,240 | |
| SBDIL Totals | \$ 1,250,000 | 2,410,493 | | 33,746,902 | |
| Major Committed and SBDIL Total | \$ 5,570,000 | 24,372,930 | 15 | 365,063,142 | |
| | 51% | 34% | | 38% | |

- 1.2.7 *Increased Transformational Program* – During PY11 and PY12, the Program demonstrated the value of Transformational Program activities. The Program will continue to improve on these efforts as proposed in this Plan. These activities include education, training and other similar transformational activities that may not result in immediate quantifiable energy savings, but are likely to contribute to energy savings over time.
- 1.2.8 *Equity Among Rate Classes and Among Islands* – In PY13, the Program will continue to expand its efforts to bring Program benefits to small businesses, landlord-tenant situations and other hard-to-reach (HTR) customers. Additionally, the Program will review available mechanisms that promote Island Equity and implement pilot programs where feasible to test for the best equity enhancers for each island’s particular circumstances.
- 1.2.9 *Reemphasis on Energy Usage Evaluation & Customer Targeted Offerings* – The Program has found that the use of evaluated and peer compared monthly energy data is a good tool to target and engage interest and participation in energy conservation and efficiency efforts. This provides customers with valuable information about their energy usage, and feedback on prior actions taken that can be used to justify projects to owners and get approval of energy efficiency actions. The Program will expand the effort to automate and make the program more widely available as well as use the peer comparisons and benchmarking to promote the best-of-the-best operational awards. The Program will also utilize time-of-use data, energy use benchmarking, and opportunity screening for in depth review of energy usage patterns to identify savings opportunities

1.2.10 *Turn-Key and Direct Install Programs*— The Program demonstrated success in procuring turn-key programs and services from specialty vendors, including OPOWER peer comparison in PY10/11/12 and NEED.org teaching modules PY11/12. These turn-key programs have proven to be cost effective methods to secure highly skilled, top-notch services that the Program will continue into PY13. The following are examples of programs to be continued for PY13:

- Educational and Training – Programs to drive capabilities for the Building Operators and decision makers such as Building Operator Certification (BOC) training, International Facility Management Association (IFMA) local technical training seminars, Association of Energy Engineers (AEE) certification classes and testing for Certified Energy Managers (CEM) and Certified Energy Auditor (CEA), Energy Efficiency Funding Group (EEFG) Selling Energy Efficiency seminars.
- Small Business and Residential Direct Install Measures – Direct install and audit services from small local energy firms and community-based service organizations to provide energy audit and retrofits will expand beyond lighting.
- Restaurant Exhaust Fan Demand Ventilation Control – Direct install of exhaust fan demand ventilation control for small restaurants
- Central Plant Benchmark Metering – Installation of plant kW per ton metering to assist in developing peer group comparison of plant efficiencies as well as to aid customer commissioning efforts and the evaluation of the sea water air conditioning development.

1.2.11 *Attention on Island Equity* – The program has addressed the County of Hawaii’s concerns that its ratepayers paying into the Public Benefits Fund have not historically received their share of the Program’s incentives. In PY12, the Program developed and implemented a direct-install Solar Water Heating installation offering for hard-to-reach households in Hawaii County, which exceeded the Program’s island equity contribution to the county.

The Program will continue to expand its outreach, education and training for both Maui and Hawaii counties and continue with direct-install efforts for small businesses and residents with enhanced solar and other targeted special incentive initiatives.

1.2.12 *Increasing Program Name Recognition* – It is recognized that there is a need for sustained emphasis on advertising, marketing and public relations to increase the brand name recognition. Advertising has been modest, but has been able to show increased Program exposure and recognition. Increased brand recognition will help the Program attract all potential customers and avoid any potential losses due to consumer confusion as to what entity to contact for incentives. In conjunction with this, the Program will continue to expand and upgrade the Program website to increase ease of use and encourage greater participation. The Program will explore methods to measure the effectiveness of advertising and other marketing efforts where possible to ensure funds are used efficiently.

1.2.13 *Proposed New Avoided Cost Table for TRB* – Hawaii Energy will work with the Contract Manager and the Energy Efficiency Portfolio Standards (EEPS) Avoided Cost Subcommittee to determine proposed updated Utility Avoided Cost figures.

These new values will be used to determine new TRB values that are more reflective of the current benefits to the Utilities and passed on to their customers.

The new HECO IRP information just released this year and the historical monthly avoided cost numbers provided by the HECO companies will be used to determine the new values.

It is understood that the TRB goals will need to be adjusted when the new avoided costs are agreed upon.

2.0 Outreach & Marketing Communications

2.1 Overview

Front and center, the overarching objective of the Program's Outreach & Marketing Communications (Marcom) is to increase active ratepayer participation in Hawaii Energy offerings (i.e., residential rebates, business incentives and transformational educational/training opportunities). During preparation for and continuously throughout the program year, specific objectives and tactics for each of the various channels of traditional and non-traditional Outreach & Marcom are strategized, developed, refined, executed and analyzed pre and post-execution to maximize reach and effectiveness.

For PY13, the Program will review and leverage successes and lessons learned to refine and enhance strategies and tactics already proven effective, as well as explore additional innovative, cost-effective and wide-reaching opportunities. Key objectives and strategies are highlighted below:

2.2 Key Objectives

Key PY13 objectives for the Program's Outreach & Marcom include continuing to:

- Generate awareness of what Hawaii Energy is and our role in the energy efficiency and conservation arena.
- Promote Hawaii Energy as the "partner" and "ally" for Hawaii, Honolulu and Maui county ratepayers as they consider and adopt conservation behaviors, and integrate energy-efficient equipment.
- Improve awareness, engagement and participation in Hawaii Energy's residential, business and transformational offerings.
- Promote a call-to-action by driving traffic to Hawaii Energy's website and call center for further information on Hawaii Energy offerings.

2.3 Outreach

The Program will expand our community outreach efforts to continue to bring awareness of Program rebates and offers to the general ratepayer population and business communities. A few highlights of our outreach efforts include:

- **Traditional Outreach** – The Program will continue to sponsor and/or participate in as many community and trade expo events as possible. Participation in these events will be determined based on factors including past history, audience, attendance and location. In addition, as appropriate, Program personnel will join and participate in professional organizations that are important for the Program to support as an active member, provided there is no actual or appearance of conflict of interest.
- **Outreach Through Community Allies & Organizations** - The Program will continue to seek and partner with organizations that share a common or similar objective of helping the community through environmental and/or sustainable efforts. In addition, the Program will further develop strong working relationships and partnerships with nonprofit organizations focused on health and human services to increase outreach with “hard-to-reach” populations.
- **Collaborate with Hawaii Businesses and Organizations** - Hawaii Energy will increase collaboration with private businesses to increase reach and distribution of easy-to-understand and apply information about efficiency and conservation.

2.4 Marketing Communications

Effectively leveraging and executing Marcom requires an in-depth knowledge of the pros and cons of all traditional and non-traditional channels at the strategic and practical hands-on execution level. The Program has this strong know-how and experience with key Marcom industry-recognized channels including those highlighted below in: (1) public relations; (2) website; (3) social media; (4) email marketing; (5) marketing collateral; (6) co-op marketing with trade allies; (7) direct mail; and (8) advertising.

A. Public Relations

For the Program, public relations encompasses: (1) media relations and (2) program positioning. Objectives include:

- Increase awareness and understanding of Hawaii Energy and the important role that it plays in helping ratepayers reduce electricity use in Hawaii.
- Position Hawaii Energy as the leader of or trusted resource for energy efficiency and conservation.
- Create understanding and confidence that energy efficiency and conservation actions can be done easily and effectively; and showcase the benefits of leading an energy-efficient lifestyle.
- Improve participation from “hard-to-reach” segments in Hawaii Energy offerings.
- Generate general ratepayer engagement and participation in Hawaii Energy offerings.
- Secure additional “third-party endorsements” of Hawaii Energy from the media, as well as key community leaders and stakeholders. For example, as appropriate, the Program would provide conservation tips and key Program rebate highlights to policymakers for consideration and inclusion in their communications with constituents (e.g., via newsletters, emails and town hall meeting announcements, presentations and/or collateral).
- Target one major media hit per month.
- Pitch case studies, success stories and human interest stories to the media and other mass, trade or community communication gatekeepers (e.g., professional organization newsletters), as well as incorporate into other appropriate medium including but not limited to website, social media and other program communications.

B. Website

In PY13, the Program will refine the new website, which is anticipated to be launched in Q4 of PY12. On a continuing basis, the Program will humanize and keep the website fresh with frequent updates and features including but not limited to highlights of photos and stories about community outreach events, trainings and success stories.

Additionally, we will focus on developing “responsive design” across all platforms. This will require additional HTML coding of the website to make it viewable and useable across smartphones and tablets. The structure of the site will be flexible and reformatted accordingly for better usability across different browser sizes, devices and platforms.

C. Social Media

With the growing prevalence of social media, the Program will continue to expand our brand presence, promote offerings and highlight success stories through various social media channels including but not limited to Facebook, Twitter and Instagram.

We will continue to connect with our social media followers by providing engaging and interactive content. In addition, we will continue to explore additional, innovative ways to keep the interest of our followers.

D. Email Marketing

In PY13, the Program will continue to develop and implement a robust email marketing system to support program communications, including but not limited to regularly occurring e-newsletters and event email blasts to opted-in “subscribers” of one of three general categories: (1) “residents” (i.e., general population ratepayer); (2) “businesses” (i.e., business entities); and (3) “energy professionals” (i.e., individuals and/or entities in the energy efficiency and/or conservation industry, such as solar water heating trade allies and vendors).

In addition, we will improve: (1) the ability to grow and maintain email audiences and (2) email marketing communications integration/sharing with web and social media communications.

E. Marketing Collateral

To support all Marcom and program objectives, as appropriate for the audience, the Program will continue to:

- Extend the Hawaii Energy identity and brand architecture into a distinctive, coordinated and effective collateral communications system.
- Develop a collateral system that supports the offering plans for the residential, business and transformational programs.
- Ensure that important information is written and organized in an easy-to-understand manner for strategic partners, trade allies and ratepayers.

F. Co-Op Marketing with Trade Allies

In PY13, the Program will continue to explore, create and refine co-op marketing opportunities with trade allies to include participating contractors, manufacturers and financial institutions as appropriate. This will enable us to partner with our allies, increase our brand awareness and maximize our marketing budget.

G. Direct Mail

The Program recognizes that segments of the population - due to geographic, socioeconomic and/or other factors - are still very traditional in their media consumption (e.g., preference for direct mail, hard copy collateral, and print and broadcast advertising). As such, the Program will explore and consider implementing targeted direct mail and other integrated marketing efforts to promote various rebates and energy efficiency measures to businesses and residential ratepayers.

H. Advertising

By way of summary, in recent program years, the Program developed and executed an annual short-run (i.e., mainly Q4 of each PY) advertising campaign as part of an integrated marketing campaign to promote a specific residential offering. In PY11, the campaign focused on CFLs, whereas PY12 focused on solar water heating.

In PY13, an advertising campaign – as part of an integrated marketing campaign - can be developed pending availability of budget and upon assessment and development of key, easy-to-grasp top offering(s) and call(s) to action from the residential, business and/or transformational programs for the mainstream population that consumes online, broadcast (i.e., radio, TV, online) and print (i.e., newspaper and magazines) media.

In conjunction with an advertising campaign, the Program will explore other advertising opportunities throughout the year to increase reach and awareness of Hawaii Energy offerings, as well as the Program's overall branding. We will also explore grassroots advertising media such as industry, trade and community publications and newsletters.

3.0 Transformational Actions

3.1 Overview

Market Transformation seeks to identify, assess and help overcome market barriers that stand in the way of people and business adopting energy efficiency technologies and practices. With limited resources, Hawaii Energy's transformational programs will strike a balance between creating new offers while supporting existing efforts in Hawaii, Honolulu and Maui counties.

With some key initiatives underway in the state to remove some significant market barriers such as financing energy efficiency (i.e. On-Bill Financing), Hawaii Energy will focus on changing behaviors among three major demographics: households beginning with underserved populations, workplace personnel and the technical workforce.

3.2 Key Objectives

The key objectives of the Transformational programs will be to:

- Support programs and initiatives that will have a direct impact in reducing energy consumption in the State within a five year period.
- Leverage the great work of others in the community in reaching target audiences by incorporating the Transformational initiatives as part of their missions.
- Strive to achieve sustainable transformational activity in the community, by which it may continue and evolve through support other than exclusively PBFA funding.

3.3 Behavior Modification

Hawaii Energy recognizes that the majority of the State's population struggles to understand energy usage in their daily lives. In working towards the goals of the Hawaii Clean Energy Initiative, the ignorance of energy consumption or "energy illiteracy" presents a significant impediment to progress, especially in the context of personal behavior and its impact on energy efficiency and conservation. Hawaii Energy holds the position that to affect behavior, the State's population must improve its "energy literacy", much the same way the general population has developed a basic literacy about nutrition to achieve better personal health (e.g. calories counting).

Behavior modification will be built upon the foundation of energy literacy. This began with the great work of Helen Wai, empowering people through Financial Literacy and Energy Efficiency Education. She will continue working with the hard-to-reach populations of Hawaii, Honolulu and Maui counties. The program will be developing an offering that will not only serve to develop future green employees through great internships, but will do so through an in-home mentoring program. This offer is envisioned to provide an educational experience to families while conducting a simple home energy assessment.

Hawaii Energy recognizes that developing an energy-literate population is a significant challenge that requires a long-term, sustainable approach. It is also paramount that strategies under consideration leverage the Program's limited financial and personnel resources, while achieving scale. Viable strategies that will be considered need to scale in ways that can reach thousands, if not tens (or hundreds) of thousands of people, based on a cost structure that has traditionally reached hundreds of people (i.e. conventional classroom education, tutoring, etc.). Such anticipated strategies are presumed to be based on Internet, mobile device technologies and social media. Hawaii Energy will also encourage the means for participants to gain energy literacy through practice and action in addition to acquiring the knowledge to do so.

The initial effort to achieve this scale will be through a pilot initiative that will produce and distribute lessons in energy efficiency and conservation through various means (i.e., video, infographics, images, etc.) using socially, culturally and economically-relevant messaging. The program will also develop an innovative distribution method to provide access to simple devices that can facilitate learning through discovery (e.g., understanding electricity consumption of a DVR by measuring it with a simple kWh monitor).

Finally, Hawaii Energy will develop a pilot initiative to bring in-office or at-the-workplace mentoring and education to raise energy literacy on the job. For some sectors (i.e., lodging and hospitality), a large number of employees can be accessed and the Program can provide energy literacy useful in the workplace and in the home. Initiatives under development include both hands-on engagement and facilitation by the Program, subcontractors and partners, but also in the form of packaged curriculum that can be offered through an employer and "brown bag" lunches.

3.4 Professional Development

Professional development is aimed at professionals who are either new to the working world, new to energy efficiency or both. The largest initiative will target education based upon NEED.org activities already underway. In the coming program year, Hawaii Energy will seek to recruit new teachers and make significant inroads with administrators and the

Department of Education in a “push/pull” strategy. Enthusiastic teachers want to bring energy efficiency content into the classroom. Hawaii Energy can help them “push” this agenda at the classroom level, at the discretion of each individual teacher. But for true success, Hawaii Energy will seek to engage school administrators and those at the DOE responsible for curriculum development to help integrate energy efficiency content into state education standards and curriculum. If successful, they will “pull” energy efficiency education into the classroom.

For those that may still be students or recent graduates, Hawaii Energy will support a number of internship opportunities. These internships will be offered for both residential and commercial opportunities that will provide a great educational and professional experience. Interns are anticipated to support in-home mentoring (residential energy assessments), supporting the administration of the Programs’ small business lighting participants as well as other needs under consideration.

For those in the workplace with significant business experience, but little if no knowledge of energy or energy efficiency, Hawaii Energy will seek to continue its offering of training opportunities with EEFG. This organization is adept at creating value at the intersection of energy management, real estate, finance, operations, sustainability, and professional selling. In addition to offering new online seminars, Hawaii Energy will look to maximize the value of this offer by ensuring the most qualified applicants are accepted to attend.

3.5 Technical “Know How”

Technical “know how” is focus on engineers, facility managers, architects and the like who have been around infrastructure and energy for a good part of the career, but need to enhance their technical skills. There are a number of opportunities with various companies and individuals Hawaii Energy will engage. The Program will also collaborate with industry including the local utility and professional organizations to ensure mutual needs are met without offering redundant classes. Hawaii Energy will also seek to maximize energy efficiency training that aligns with its planned portfolio of incentive offers. New this program year will be collaboration with the University of Hawaii to integrate curriculum for credit.

Hawaii Energy will address “rate class equity” by developing offers for residential, and large, medium and small businesses (G, J and P). This will be achieved by developing the right offer, marketing and/or stricter criteria to ensure we have attendees who will benefit the most.

- Behavior Modification will target ~70% to the residential ratepayer.
- Professional Development will target ~70% to the commercial ratepayer.
- Technical “Know How” will target 100% to the commercial ratepayer.

4.0 RESIDENTIAL PROGRAM STRATEGY & DETAILS

4.1 Overview

For PY13, Hawaii Energy will maintain programmatic changes adopted in PY12, specifically the incentive categories:

- Residential Energy Efficiency Measures (REEM) – This incentive category is the core of Hawaii Energy’s residential portfolio and undergoes incremental developments responding to market conditions (i.e. retail pricing) and consumer need.
- Custom Energy Solutions for the Home (CESH) – This incentive category provides a measure of flexibility within the prescriptive portfolio to accommodate unforeseen market opportunities. The budget and unit cost targets provide financial efficacy guidance to the Program and allies who champion these opportunities.
- Residential Energy Services & Maintenance (RESM) - This incentive category targets ally-driven service offerings to enhance energy savings persistence and bootstrap fledgling energy services businesses trying to secure a toehold in Hawaii.
- Residential Hard-to-Reach (RHTR) – This incentive category will seek to secure various projects among geographies and demographics that have been traditionally underserved. Efforts in PY11 and PY12 to pierce the landlord/tenant barrier of installing SWH systems were unsuccessful despite enhanced incentive offers. However, geographic barriers are seen as an opportunity for PY13.

A summary listing of the new Residential Program offerings can be found in the table below followed by a brief summary of additions and changes. A detailed description of the Residential Program offerings follows in section 4.1 through 4.4. Appendix B contains a projection of potential energy savings for the planned programs.

| Residential Programs | | |
|----------------------|--|---|
| Program | Category | Measures |
| REEM | Residential Energy Efficiency Measures | |
| | | High Efficiency Water Heating |
| | | High Efficiency Lighting |
| | | High Efficiency Air Conditioning |
| | | High Efficiency Appliances |
| | | Energy Awareness, Measurement and Control Systems |
| CESH | Custom Energy Solutions for the Home | |
| | | Target Cost Request for Proposals |
| RESM | Residential Energy Services & Maintenance | |
| | | Residential Direct Installation |
| | | Residential Design and Audits |
| | | Residential System Tune-Ups |
| RHTR | Residential Hard to Reach | |
| | | Energy Efficiency Equipment Grants |
| | | Landlord, Tenant, AOA Measures |

4.1.1 *New Program Offerings of Residential Energy Efficiency Measures (REEM)* High Efficiency Lighting

- LED Lighting – While not new to the residential portfolio, Hawaii Energy anticipates the availability of ENERGY STAR® certified products to surge, particularly for popular A19 bulbs, while retail prices fall, providing an attractive energy savings option to residential consumers. The Program will closely follow availability (rising) and pricing (decreasing) in order to maintain adequate incentive levels.

High Efficiency Appliances

- High Efficiency Pool Filtration Pump Systems – This is an incentive for residential pool pumping technologies that offer 40% to 60% savings when using newer pump technology including variable speed/flow controls, improved motors and pump designs.
- Hawaii Energy plans to continue all PY12 offers, while improving retail merchandising.

Energy Awareness, Measurement and Control Systems

- Peer Comparison – Hawaii Energy plans to continue the OPOWER Home Energy Report peer comparison program, which was expanded to the Neighbor Islands in PY11. The market for peer comparison initiatives is evolving in PY13 to include social media and consumer-based rewards programs. Hawaii Energy's strategy will look for ways to affect measurable energy savings through behavior change in both residential and transformational portfolios by evaluating the evolving options arising in the market.

While not new to the residential portfolio, the market approach to promoting the following offers will evolve, specifically:

- Whole House Energy Metering – Hawaii Energy will explore targeting specific high-use households to consider this measure, which will undergo a review of qualifications.

4.1.2 New Program Offerings of Custom Energy Solutions for the Home (CESH)

Target Cost per KWh Request for Proposals

- Custom Packaged Proposals – This program will target and encourage contractors, home auditors, and energy vendors to develop cost-effective projects that focus on high energy consumption homes. The program will be a call for projects that meet a total dollar per kWh savings target and allow the market to be creative in the actions and measures that achieve the targeted cost per kWh energy savings. The projects will use utility metered data and be sub-metered if required to ensure savings performance.

Residential Design and Audits

- Efficiency Inside Home Design – This measure provides developers with financial, technical and other assistance to promote the construction of homes that require the least amount of air conditioning to meet customer demands. It is assumed that all new homes will have solar water heating, Energy Star appliances and CFLs. It is expected that the best built homes will provide 20-30% reduction in energy consumption as compared to IECC 2006 code built homes. Net zero homes will provide 100% reductions.

Residential System Tune-Ups

- SWH System Tune-Up – Hawaii Energy will implement a seasonal offer based on the results of the Solar Tune-Up Pilot conducted in PY11 and complement the Solar Water heating marketing and incentive push in PY12.

4.1.3 *New Program Offerings of Residential Hard-to-Reach (RHTR)*

Energy Efficiency Equipment Grants

- Solar Water Heater (SWH) Incentive – Hawaii Energy will provide approximately 56 solar water heating systems (anticipated to be provided as a no cost service) for those hard-to-reach segments in the most need.

4.1.4 *Additional Residential Program Initiatives*

Program Promotion of Professional Recycling and Disposal – Hawaii Energy is continuing to expand program offerings that incentivize recycling and disposal to take less efficient appliances off the grid. Through these initiatives, we are also supporting local small businesses to handle the recycling or appropriate disposal. As LED lighting options continue to increase, Hawaii Energy will explore opportunities to expand CFL recycling options, particularly on the Neighbor Islands.

Point of Purchase (POP) Rebates – Hawaii Energy expanded the highly successful POP rebates of CFLs to other incentivized products. Hawaii Energy will continue to explore viable options to continue this offering that makes it easier for the customer to obtain their rebate and lead to greater penetration of consumers.

- 4.1.5 Residential Program Details Table of Contents. To follow, in Sections 4.2 through 4.6, is an overview summary of Residential Program Offerings followed by detailed descriptions and energy savings. The Overall Program Details are provided on the following page, preceding the individual Program summaries.

4.2 All Residential Programs Overview

4.3 Residential Energy Efficiency Measures (REEM)

- 4.3.1 High Efficiency Water Heating
- 4.3.2 High Efficiency Lighting
- 4.3.3 High Efficiency Air Conditioning
- 4.3.4 High Efficiency Appliances
- 4.3.5 Energy Awareness, Measurement and Control Systems

4.4 Custom Energy Solutions for the Home (CESH)

- 4.4.1 Target Cost Request for Proposals

4.5 Residential Energy Services & Maintenance (RESM)

- 4.5.1 Residential Direct Installation
- 4.5.2 Residential Design and Audits
- 4.5.3 Residential System Tune-Ups

4.6 Residential Hard-to-Reach (RHTR)

- 4.6.1 Energy Efficiency Equipment Grants
- 4.6.2 Landlord, Tenant, AOA Measure

|--|--|
| Program Category | 4.3 Residential Energy Efficiency Measures 4.3.2 High Efficiency Lighting |
| Description & Implementation Strategies | <p>The CFL and LED rebates are offered through manufacture direct incentives which are provided as point of sale cost reductions. The process includes:</p> <ul style="list-style-type: none"> • Distributors, retailers and manufacturers complete a Memorandum of Understanding (MOU) cooperative agreement in which they provide funds for the advertising, promotion for instant rebates for the CFL and LEDs to customers • Retailers signing the MOU agree to display signage showing the rebate has been provided by the Program, provide assistance in ordering and stocking qualifying products, and provide sales staff training • Retailers agree to promote consumer education, undergo staff training and follow proper procedures. • Retailers with the ability to track incentives using sales data are given the option for issuing rebates without the use of coupons, provided they can demonstrate the ability of providing accurate, timely data on point of purchase information by store by SKU <p>Trade Allies</p> <p>The program is implemented through strong working relationships between the program, the major CFL/LED manufacturers and the national retailers. The participating CFL manufacturers are: GE, FEIT, Sylvania, TCP and Philips. Participating retailers include: Ace Hardware, City Mill, Costco, Don Quijote, Foodland, Home Depot, Longs Drugs/CVS, Lowes, Safeway, Sam's Club, Times and Wal-Mart who have all utilized their buying power to offer a better blend of quality, affordable CFLs across the State.</p> |
| Key Changes | <ul style="list-style-type: none"> • Development and introduction of a custom lighting rebate offer targeting customers who engage with lighting designers and specialty shops. With a growing selection of EnergyStar® qualified specialty LED products, Hawaii Energy has a small but growing number of small businesses serving this clientele, with no option to benefit from lighting incentives. • Reducing incentive levels for LEDs particularly for new lower cost / higher lumen A19s. • Provide for increased recycling options for CFLs. |
| Marketing Strategies | <ul style="list-style-type: none"> • Significant focus on merchandising, including more requirements for in-store signage featuring Hawaii Energy brand and incentive amounts • Advertisements to explain how to select a CFL • Educational information online and in the media • Leverage allies to share CFL information and increase participation • Encourage an increase in selection of CFLs available • Social media |

5.0 BUSINESS PROGRAM STRATEGY & DETAILS

5.1 Overview

For PY13, Hawaii Energy will maintain programmatic changes adopted in PY12, specifically these incentive categories:

- **Business Energy Efficiency Measures (BEEM)** – This category offers incentives for standard, known energy efficiency technologies in the form of prescriptive incentives in a streamlined application and grant award process.
- **Custom Business Energy Efficiency Measures (CBEEM)** – This category offers incentive for non-standard energy efficiency technologies often needed for commercial and industrial customers who need to invest in energy efficiency opportunities specific to unique project specific processes and designs, for example. Incentive award amounts are determined via calculations performed to quantify specific energy savings related to unique applications.
- **Business Energy Service and Maintenance (BESM)** – This incentive category focuses on developing viable projects through collaboration, competition and direct support in the form of expertise and/or equipment (i.e. metering).
- **Business Hard-to-Reach (BHTR)** - This incentive category aims to secure various projects among geographies and demographics that have been traditionally underserved such as retail, restaurants and other small businesses.

A summary listing of the new Business Program offerings can be found in the table below followed by a brief summary of additions and changes. A detailed description of the Business Program follows in sections 5.2 through 5.6. Appendix B contains a projection of potential energy savings for the planned programs.

| Business Programs | | |
|-------------------|---|----------|
| Program | Category | Measures |
| BEEM | Business Energy Efficiency Measures | |
| | High Efficiency Lighting | |
| | High Efficiency HVAC | |
| | High Efficiency Water Heating | |
| | High Efficiency Water Pumping | |
| | High Efficiency Motors | |
| | Commercial Industrial Processes | |
| | Building Envelope Improvements | |
| | Energy Star Business Equipment | |
| | Energy Awareness, Measurement and Control Systems | |
| CBEEM | Custom Business Energy Efficiency Measures | |
| | Customized Project Measures | |
| BESM | Business Service and Maintenance | |
| | Business Direct Installation | |
| | Business Design, Audits and Commissioning | |
| BHTR | Business Hard to Reach | |
| | Energy Efficiency Equipment Grants | |
| | Landlord, Tenant, AOA Measures | |

5.1.1 *New Program Offerings of Business Energy Efficiency Measures (BEEM)*

High Efficiency HVAC

- High Efficiency Chillers – The savings produced by high efficiency chillers is very specific for the location and the dependence of the “balance of system,” pumps, controls etc. These incentives will be modified to encourage a methodical selection method and the savings calculated using modeling or spreadsheet analysis with appropriate system conditions (condenser water, flow rates, etc.). This offer will require kW/ton metering.

Commercial Industrial Process

- Waste Water – Wastewater facilities are 24/7 facilities that have specific technical requirements, high capital costs and long procurement process. This targeted program will target the two highest energy consumers in the plants, Air Systems & UV Lighting through process improvements. A list of private waste water facilities will be leveraged in targeting opportunities in PY13.

Sea Water Cooling

- Hawaii Energy will continue to support this evolving project in PY13 through metering and providing ad hoc resources as needed. The Program will pay incentives as directed in earlier proceedings upon installation and start up of the SWAC system.

5.1.2 *New Program Offerings of Customized Business Energy Efficiency Measures (CBEEM)*

Customized Project Measures

- No new program offering

5.1.3 *New Program Offerings of Building Energy Services and Maintenance (BESM)*

Business Design, Audits and Commissioning

- Decision Maker: Real-Time Submeters – There are individuals within business organizations who have influence over a large number of employees whose behavior within the work environment drive unnecessary energy consumption (e.g., leaving on lights, additional electronic equipment, etc.). This offer is the direct installation of a web-based electrical metering device. This metering will be monitored by the decision maker(s) within the organization to identify usage patterns and be the basis of peer group competitions within the organization.

5.1.4 *New Program Offerings of Business Hard-to-Reach (BHTR)*

Energy Efficiency Equipment Grants

- Direct Install – Water Cooler Timers – This program will utilize the Home & Office Delivery (HOD) water services providers to install digital timers on hot/cold water dispensers in order to save the stand-by losses in the cold and hot tanks during times that the systems are not being utilized.

Restaurant Targeted Participation Programs

- Low Flow Spray Rinse Nozzles – This measure was included to assist the program in driving up the cost effectiveness of the portfolio. This measure saves water first and then electricity in the form of lower water heating requirements. Hawaii Energy will engage with the water companies to jointly develop and promote this measure.

ENERGY STAR Commercial Kitchen Equipment

- ENERGY STAR® Kitchen Equipment – This program will focus on raising awareness of energy efficiency options when replacing equipment at end-of-life.

5.1.5 Business Program Details Table of Contents. To follow, in Sections 5.2 through 5. 5, is an overview summary of Residential Program Offerings followed by detailed descriptions and energy savings. The Overall Program Details are provided on the following page, preceding the individual Program summaries.

|--|---|
| Program Category | 5.2 All Business Programs Overview of All Business Programs |
| Market Barriers | <p>General</p> <ul style="list-style-type: none"> • Lack of familiarity with availability of energy efficient technology and the vendors offering these services and products • Trust and creditability of technology providers • Unaware of business benefits of reducing exposure to cost of energy changes • High initial up-front cost • Life Cycle Cost vs. Simple Payback decision analysis • Need for a cash positive investment • Access to and/or understanding of financial options • Lack of knowledge of operation and maintenance of technologies <p>Landlords and Property Managers</p> <ul style="list-style-type: none"> • May not pay for electricity cost • Reluctance to invest without a financial return • Property is a short term investment <p>Renters and Lessees</p> <ul style="list-style-type: none"> • Do not have the authority or responsibility for the systems • Renter lease term shorter than simple payback for a measure |
| Description & Implementation Strategies | <p>Technology Based Categories High Efficiency Lighting, HVAC Water Heating Water Pumping Motors Building Envelope Improvements, Energy Star Business Equipment</p> <p>The technology based incentives are provided for energy efficiency products that provide reliable energy savings for a wide array of customers. These incentives are developed to be based on fixed amounts per technology with performance adjustments to reflect the savings potential to ensure program cost-effectiveness set based on expected savings.</p> <p>Measures are selected and reviewed to determine that the energy savings can be reliably deemed, or calculated using simple threshold criteria.</p> |

| | |
|--|--|
| Program Category | 5.2 All Business Programs Overview of All Business Programs |
| Description & Implementation Strategies (continued) | <p>The implementation process includes:</p> <ul style="list-style-type: none"> • Program performs outreach and promotions to inform customers of incentive opportunities. • Customer selects and approves purchase and installation of energy efficiency measures • Customer sends in completed application forms with scheduling and supporting documentation • Customer provides evidence of installation and/or program will verify the installation <p>Hawaii Energy processes the incentive on approved applications on an as-funds available basis</p> <p>Energy Awareness, Measurement, and Control Systems</p> <ul style="list-style-type: none"> • Provide peer groups with Customized Hawaii specific Energy Use Intensity reports. These comparisons show their usage in comparison to their peers currently on an entire facility basis and as the program progresses we will disaggregate the comparisons down to the technologies “categories.” • Provide self-assessment forms that the customer can complete on their own to identify potential savings. • Increase the use of incentives such as the Condominium Submetering that combine cash incentives with the requirement for educational components and the execution of audits to promote further energy savings activity in the facilities. |
| Key Changes | <ul style="list-style-type: none"> • Program baseline efficiency thresholds will be adjusted for new IEER AC ratings and review of efficiency levels as necessary to coincide with the adoption of IECC 2006 and IECC 2009 energy codes • Expand prescriptive selections for LED lamps that achieve ENERGY STAR status. • Chiller incentives based on kWh savings, Chiller selection model and kW/ton BTU metering. • Kitchen Exhaust Hood Incentive • Electronically Commutated Motors (ECM) for fan coil and evaporative fans. • Provide budget to match cofounded energy projects. This was developed with Hawaii Energy’s work with HTDC (High Technology Development Corporation) to move projects in targeted industries. • ENERGY STAR Commercial Kitchen Equipment. |

| | |
|-----------------------------|--|
| Program Category | 5.2 All Business Programs Overview of All Business Programs |
| Marketing Strategies | <ul style="list-style-type: none"> • Web-based application forms will be advertised and made available to customers and their channel allies (lighting, cooling, motors, and controls). • Train and recruit program allies from various channels as program partners to enhance sales of their energy efficiency equipment • Maintain direct contact with key market players to understand the markets and decision points and to leverage their marketing resources to inform members • Email informational campaigns • Award and publish success of customer and ally partners to demonstrate highest level leadership in an effort to pull the market. |

| Incentives | Package Units | <u>Incentive</u> \$200 | <u>Units</u> 500 | Tons |
| Description & Implementation Strategies | <p>ENERGY REDUCTION OPPORTUNITY</p> <p>The air-cooled package units are most often found in small commercial facilities as they are least first-cost and maintenance intensive of HVAC options to this market. The units are often roof-top mounted and feed constant volume distribution systems. The most cost effective opportunity to reduce energy consumption in these units are to replace them with the highest efficiency unit available and potentially convert at the same time to a VAV distribution system to increase both comfort and reduce cooling loads. A higher cost option is to convert to VRF split systems.</p> <p>TARGET AUDIENCE</p> <p>Who – Property Managers & Private and Public Facilities Directors. Air Conditioning/Mechanical Contractors, Mechanical Engineers</p> <p>What – Small Commercial facilities.</p> <p>INCENTIVE & TARGETED ECONOMICS</p> <p>The offering of prescriptive incentives based on the EER of the units starting at a 15% higher than IECC 2006 / ASHRAE 2004 standards. The incentives increase with higher efficiency levels. This level of incentive should eliminate the incremental difference between a standard efficiency unit.</p> <p>APPLICATION PROCESS</p> <ol style="list-style-type: none">1. | VFR Split Systems – New Construction | \$250 | 500 Tons | | | | | | | | | | | | | | | | |
| Description & Implementation Strategies | <p>ENERGY REDUCTION OPPORTUNITY</p> <p>Inverter driven variable refrigerant flow (VRF) air conditioning systems are direct expansion AC systems that utilize variable speed evaporator/condenser fans, and a combination of fixed and variable speed compressors along with most often multiple individual zone evaporators to provide the ability to more closely match the AC system’s output with the building’s cooling requirements. A potential of 20 to 35% energy savings come from:</p> <ul style="list-style-type: none">• <i>Part Load Efficiencies</i>: Increased part-load efficiency operation• <i>High Efficiency Motors</i>: Many systems use ECM motors• <i>Higher Room Temperatures</i>: The capacity matching allows for better humidity control through longer cooling operation.• <i>Reduction of Distribution Losses</i>: Duct losses are reduced with DX systems. This may be offset by dedicated outside air distribution systems when needed. <p>TARGET AUDIENCE</p> <p>Who – Property Managers & Private and Public Facilities Directors. Air Conditioning/Mechanical Contractors, Mechanical Engineers</p> <p>What – Commercial facilities.</p> <p>INCENTIVE & TARGETED ECONOMICS</p> <p>The offering of prescriptive incentives based on the tonnage of the VRF system.</p> <p>This level of incentive should reduce 25% of the incremental difference between a VRF and an alternative single or two-speed standard efficiency unit.</p> | | | | | | | | | | | | | | | | | |

| Description & Implementation Strategies | <p>ENERGY REDUCTION OPPORTUNITY CEE LISTED MOTORS There is an opportunity to save energy with motors designed to utilize less power for the same horsepower of work. Motors in many applications (Water pumping and air handing) have long operational hours and are often out of sight and mind until they fail.</p> <p>The CEE Premium Efficiency Specification will be the qualification level for motors. This is driven by the December 2010 implementation of the Energy Independence and Security Act of 2007 (EISA) requiring the vast majority of new electric motors to meet NEMA Premium Efficiency standards.</p> <p>ECM There is an opportunity to save energy with ECM motors that have higher electrical efficiency (Electronically Commutated Motor, 70 percent efficient) than PSC (Permanent split capacitor, 49 percent efficient) or shaded-pole (32 percent efficient). In addition, “cooler” motor operation creates less heat load on the conditioned space.</p> <p>When motors fail there is often an operational urgency to replace them at the lowest first-cost as the replacement was not budgeted.</p> <p>TARGET AUDIENCE Who – Property Managers, Mechanical & Electrical Contractors, Motor Repair/Rewind Shops, Motor Distributor and Supply houses What – All Refrigeration and PTAC units</p> | | |

5.3.6.1 – Kitchen Exhaust Hood Demand Ventilation

Projected Impacts

| | | |
|------------------|------------|------|
| Demand | 56 | kW |
| Energy | 327,907 | kWh |
| Incentive Budget | \$ 105,000 | (1%) |
| Cost per kWh | \$0.32 | /kWh |
| TRB | \$608,788 | |

Incentives

| | <u>Incentive</u> | <u>Unit</u> |
|---|------------------|-------------|
| Kitchen Exhaust Hood Demand Ventilation | \$700/hp | 150 hp |

Description & Implementation Strategies

ENERGY REDUCTION OPPORTUNITY
Kitchen ventilation with demand control hood exhaust uses temperature and/or smoke sensors to adjust ventilation rates. This saves significant energy comparing with the traditional 100% on/off controls.

Traditional ventilation systems operate at one speed regardless of how hard the appliances are working. Demand Control Kitchen Ventilation systems respond to variations in stove use, allowing the two-speed or variable speed fans to regulate exhaust and makeup airflow as necessary. Therefore, when stoves are off or only a few burners are in use, the exhaust fans work at lower speeds and use less energy.

TARGET AUDIENCE
Restaurants, hotels, universities and hospitals.

INCENTIVE & TARGETED ECONOMICS
Incentive amounts will differentiate based on existing or new construction applications..

APPLICATION PROCESS

To qualify for a Hawaii Energy Commercial Kitchen Demand Ventilation Controls Rebate, the following conditions must be met:

- The control system must be used in conjunction with variable speed fan motor controls.
- All motors must meet NEMA Premium Efficiency standards and be UL® Approved
- Temperature or optical fume sensors must have the ability to sense and ramp up or down the ventilation rate based on the presence of temperature, smoke or steam from cooking activity

- Temperature and Infrared cooking sensors must have the ability to measure temperature at the cooking surface to ramp ventilation up or down based on when cooking starts
- Hawaii Energy Incentive Worksheet must be submitted with incentive application

COMPLEMENTARY PROGRAMS

- ENERGY STAR Kitchen Equipment
- SBDI – Restaurant Lighting
- Low Flow Spray Rinse Nozzles

| Description & Implementation Strategies | <p>PROGRAM OBJECTIVE</p> <ul style="list-style-type: none">This program is designed to assist master-metered condominiums and their Association of Apartment Owners (AOAO) to install billing sub meters for their units and common areas to drive energy conservation and ensure equity and fairness in allocating energy costs to tenants and/or owners of their condominium units. The knowledge of personal energy usage and the responsibility to pay for it can result in energy usage behavior modification and reward those making investments in energy efficient equipment.The combination of billing sub meters, along with education, peer group comparisons and special equipment offerings, will assist the owner or tenant to achieve significant energy conservation and efficiency.Provides the AOAO an opportunity to receive an energy audit of the property and participate in other Hawaii Energy incentives for conservation in all common areas. Possible incentives could include A/C, lighting, pool pumps, domestic water pumps and parking garage exhaust fans. <p>INCENTIVE</p> <ul style="list-style-type: none">The payment of this \$150 per unit metered incentive is payable to the AOAO towards the purchase and installation of a third party sub metering system. The metering system is to be used for billing purposes so that each owner or tenant of the unit metered will be responsible for the payment of their own electric consumption.Incentive payment will be made upon completion of: installation of each meter and billing system, tenant education sub metering workshop, energy audit of the AOAO property and commencement of real time billing to individual tenants.Incentive payment cannot exceed 50% of total project cost. | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| | |
|--|---|
| Program Category | 5.3 Business Energy Efficiency Measures 5.3.9 Energy Awareness, Measurement and Control Systems 5.3.9.2 Condominium Submetering |
| Description & Implementation Strategies (continued) | <p>ENERGY SAVINGS</p> <ul style="list-style-type: none"> It is expected there will be at least a 10% reduction in energy usage; however, there is no minimum reduction in electrical use required to retain the incentive. Currently the M&V Review suggests 3.8% this will be reviewed as compared to actual project performance. <p>REQUIREMENTS</p> <ul style="list-style-type: none"> The metering system must remain in place and billing to occur for a period of at least five (5) years or a pro-rated portion of the incentive will be recovered by Hawaii Energy. Energy meter data (sub metered billing statements) must be provided to Hawaii Energy for analysis purposes. A joint educational and monitoring program will be undertaken with AOAO to assist in the verification of savings and development of an ongoing energy incentive offering for other condominiums in Hawaii. <p>Components of the Pilot Program:</p> <ul style="list-style-type: none"> Physical verification review of meters serving the building. Review monthly billing history AOAO to provide monthly individual data collection for a two month period after meter installation to Hawaii Energy. This would be the mock billing information that is supplied to the tenant. Sub Metering system installation inspection review Identification of Top (T) and Bottom (B) 5 energy users for the purpose of peer comparison. All information will be anonymous. AOAO to host sub metering and energy conservation and efficiency workshops presented by Hawaii Energy. A free energy efficient power strip will be given to encourage attendance. (If power strips are not available, Hawaii Energy reserves the right to offer a comparable promotional item.) CFL's and LED's can be purchased utilizing the point of purchase rebates made available by Hawaii Energy in retail outlets throughout the state. AOAO owners/tenants are eligible for Energy Star Appliance rebates and can purchase Energy Star appliances through major retailers throughout the state. |

| Market Barriers | <ul style="list-style-type: none">• Risk Avoidance• Market acceptance of new technologies• Lack of familiarity with availability of energy efficient technology• High initial up-front cost• Life Cycle Cost vs. Simple Payback decision analysis• Need for a cash positive investment• Access to and/or understanding of financial options• Lack of knowledge of operation and maintenance of technologies | | | | | | | | | | | | | | | | | |
| Description & Implementation Strategies | <p>Customized Application Process</p> <p>This program will provide a custom application and granting process for participants to receive incentives for installing non-standard energy efficiency technologies. The intent of this structure is to enable customers to invest in energy efficiency processes and technology measures that may require calculations of energy savings for specific, unique applications. Incentive awards will be based on calculated savings that ensure program cost-effectiveness.</p> <p>The process includes:</p> <ul style="list-style-type: none">• Program performs outreach and promotions to inform customers of incentive opportunities• Customer learns about the program offerings through various channels• Customer may call the program to request assistance. <p>Customer or his agent must submit a brief proposal that describes the project and includes estimates of energy savings and payback</p> <ul style="list-style-type: none">• Engineering calculations are required and may be reviewed either internally or with a third-party engineering firm• Program provide feedback on the project to clarify if needed | | | | | | | | | | | | | | | | | |

| Description & Implementation Strategies | <p>The program will provide an open opportunity for achieving energy efficiency by developing cost-effective projects that focus on high energy consumption businesses.</p> <p>The program will be a formal offer of matching or leveraging funds for projects that have not moved forward even with other sources of funding. The example were the HTDC (High Technology Development Corporation) funds for energy studies that were not fully subscribed due to the customers not having the remainder of the funding to execute. This co-funded work resulted in 2010 in eight energy studies resulting in at least one immediately implemented project.</p> <p>The projects will use utility metered data and if needed, will be submetered to ensure savings performance.</p> | | | | | | | | | | | | | | | | | |

| | <u>Incentive</u> | <u>Unit</u> | | | | | | | |
| Benchmark Metering | \$80,000 | 4 Groups | | | | | | | |
| Description & Implementation Strategies | <p>The Benchmark Metering incentive is designed to encourage business customers to install a central chiller plant metering and data logging system that will provide real-time data and trend data. This data reflects actual tons of cooling and measured efficiency in KW per ton. The new equipment will make it possible for the customer to set meaningful energy efficiency goals and track progress towards those goals. With the Hawaii Energy incentive, there is no cost to the customer for the metering equipment or installation (up to \$80,000).</p> <p>Procedure:</p> <p>Customer:</p> <ol style="list-style-type: none">1. Have a central chiller plant (or a central chiller plant project in the planning phase) with a total building electrical energy consumption of at least 3 million kWh per year.2. Complete and submit Central Chiller Plant Benchmarking Application3. The Hawaii Energy monitoring and data acquisition server shall be located at the customer’s site and connected to the internet via customer’s connection.4. Submit to Hawaii Energy all payee information and the IRS Form W-9 at the beginning of every calendar year for processing of the IRS Form 1099. It is understood that Hawaii Energy will forward a copy of the IRS Form 1099 to the payee at the end of the calendar year.5. Agree to inspection of project for up to 5 years after completion <p>Industry Partners:</p> <ol style="list-style-type: none">1. Assist customer in submission of application, savings estimate worksheet, and project proposal. | | | | | | | | |

* This table provides a program-level itemization of the overall contract budget. While the contractual budget categories and limitations are as set forth in the contract, the Hawaii Energy team will continue reporting status of budget and expenditures at the program-level, consistent with prior years. Formal changes to the contract budget will be in accordance with the contract.

7.0 PERFORMANCE INCENTIVE GOALS AND INCENTIVE WEIGHTING

7.1 Performance Incentive Goals

The following table shows the PY13 Program Performance Goals and Incentives as contained in the supplemental contract covering the PY13 budget. The transition between Minimum, Target and Maximum shall be calculated on a linear basis for both goals and awards where appropriate.

| PY2013 Performance Goals | | | | |
|---|-----------------------|----------------------|----------------|--------------|
| Performance Target Item | Performance Goals | | | |
| | Minimum | Target | Maximum | |
| | 75% | 100% | 110% | |
| First Year Energy Reduction | 106,212,107 | 141,616,143 | 155,777,757 | kWh |
| Peak Demand Reduction | 13,366 | 17,821 | 19,603 | kW |
| Total Resource Benefit | \$ 132,760,481 | \$ 177,013,974 | \$ 194,715,371 | \$ |
| Transformation Infrastructure Development | Minimum Participation | Target Participation | | |
| Behavior Modification | 13,500 | 18,000 | | |
| Professional Development | 750 | 1,000 | | |
| Technical "Know How" | 1,500 | 2,000 | | |
| Island Incentive Equity | Minimum | Target | Maximum | Contribution |
| | 80% | 100% | | |
| County of Hawaii | \$ 1,987,202 | \$ 2,484,003 | n/a | 12.6% |
| C&C Honolulu | \$ 11,733,956 | \$ 14,667,445 | n/a | 74.4% |
| County of Maui | \$ 2,050,288 | \$ 2,562,860 | n/a | 13.0% |
| Total | | \$ 19,714,308 | | 100.0% |

| PY2013 Performance Incentives | | | | |
|--|-------------|-------------------------|------------|------------|
| Performance Target Item | % of Target | Program Incentive Award | | |
| | | Minimum | Target | Maximum |
| | | 75% | 100% | 123.8% |
| First Year Energy Reduction | 35% | \$ 183,750 | \$ 245,000 | \$ 303,188 |
| Peak Demand Reduction | 5% | \$ 26,250 | \$ 35,000 | \$ 43,313 |
| Total Resource Benefit | 40% | \$ 210,000 | \$ 280,000 | \$ 346,500 |
| Infrastructure development | 10% | n/a | \$ 70,000 | \$ 70,000 |
| Island Incentive Equity | 10% | n/a | \$ 70,000 | \$ 70,000 |
| Total | | | \$ 700,000 | \$ 833,000 |
| Potential Award for Performance in Excess of Targets | | | | \$ 133,000 |

7.2 Performance Incentive Fractions

The following table shows the PY13 Performance Incentive Fractions as contained in the supplemental contract covering the PY13 budget.

| Performance Target Goal | Fraction of Incentive |
|-----------------------------|-----------------------|
| First Year Energy Reduction | 35% |
| Peak Demand Reduction | 5% |
| Total Resource Benefit | 40% |
| Infrastructure development | 10% |
| Island Incentive Equity | 10% |

8.0 CONCLUSION

The Hawaii Energy Team is projecting strong energy savings results for PY12 (ending 30 Jun 2013).

Our ultimate energy efficiency and conservation success will require continuous innovation and improvement of our efficiency technologies, energy awareness education and program strategies to ensure that we stay ahead of our goals. The Hawaii Energy pledge is to engage these requirements with the best effort possible.

For PY13, the Hawaii Energy Team will continue the transparency, integrity, cost-effectiveness, innovation and singular focus on saving energy for Hawaii that have been the key hallmarks of our tenure as Hawaii's first independent Public Benefit Fee Administrator. Working under the PUC's leadership, together with our allies, government agencies, utilities and utility customers, we look forward to being a major catalyst and contributor to Hawaii's successful climb to a clean energy future.

MAHALO

1 Introduction

METHODS AND ASSUMPTIONS

This reference manual provides methods, formulas and default assumptions for estimating energy and demand peak impacts from measures and projects that receive cash incentives from the Hawaii Energy Efficiency Program.

This reference manual is organized by program, end-use and measure. Each section provides mathematical equations for determining savings (algorithms), other program Technical Reference Manual (TRM) methodologies as well as default assumptions for all equation parameters that are not based on site-specific information. In addition, any descriptions of calculation methods or baselines are provided, as appropriate.

The parameters for calculating savings are listed in the same order for each measure. Algorithms are provided for estimating annual energy and demand impacts.

Data assumptions are based on Hawaii specific data, where available. Where Hawaii data was not available, data from neighboring regions is used where available and in some cases, engineering judgment is used.

Data sources used, in the general order of preference, included, but were not necessarily limited to the following:

- Energy and Peak Demand Impact Evaluation Report of the 2005-2007 Demand Management Programs – KEMA
- HECO IRP-4: Energy Efficiency Potential Study (HECO DSM Docket)
- 2004-2005 Database for Energy Efficiency Resources (CA DEER database)
- 2007-2008 Database for Energy Efficiency Resources (CA DEER database) Update
- Other EE Program Design Information (e.g. Efficiency Maine, Focus on Energy, etc.)
- SAIC Staff expertise and engineering judgment
- Evergreen TRM Review – 2/23/12

2 Gross Customer-to-Net Program Savings Calculation

The algorithms shown with each measure calculate gross customer electric savings without counting the effects of line losses from the generator to the customer or free ridership.

The formulae for converting gross customer-level savings to net generation-level savings are as follows:

$$\text{Net Program kWh} = \text{Gross Customer Level } \Delta\text{kWh} \times (1 + \text{SLF}) \times \text{RR}$$

$$\text{Net Program kW} = \text{Gross Customer Level } \Delta\text{kW} \times (1 + \text{SLF}) \times \text{RR}$$

Where:

Net kWh = kWh energy savings at generation-level, net of free riders and system losses

Net kW = kWh energy savings at generation-level, net of free riders and system losses

Gross Cust. ΔkWh = Gross customer level annual kWh savings for the measure

Gross Cust. ΔkW = Gross customer level connected load kW savings for the measure

SLF = System Loss Factor

RR = Realization Rate that includes Free Riders and Engineering Verification

SLF – System Loss Factor

The system loss factors were provided by HECO, MECO and HELCO. They do not vary by measure, but by island, and are in the following Table 2.1:

Table 2.1

| County Customer to System Loss Factor | | |
|---------------------------------------|-------|--------|
| Oahu | Maui | Hawaii |
| 11.17% | 9.96% | 9.00% |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

RR - Realization Rate

The Realization Rate used was estimated using the following information from the Evergreen (EM&V) report:

Table 2.2

| New Net-to-Gross Factors | | |
|---|--|--------------|
| Program | | Net-to-Gross |
| BEEM | Business Energy Efficiency Measures | 0.75 |
| CBEEM | Custom Business Energy Efficiency Measures | 0.75 |
| BESM | Business Services and Maintenance | 0.95 |
| BHTR | Business Hard to Reach | 0.99 |
| REEM | Residential Energy Efficiency Measures | 0.79 |
| CESH | Custom Energy Solutions for the Home | 0.65 |
| RESM | Residential Services and Maintenance | 0.92 |
| RHTR | Residential Hard to Reach | 1.00 |
| Effective Program Total Based on PY11 Portfolio Performance | | 0.78 |

The total Net Energy Savings divided by the total Gross Energy Savings for PY13 is 78%.

3 Interactive Effects

The TRM provides specific savings algorithms for many prescriptive measures. When a customer installs a prescriptive measure, the savings are determined according to these algorithms. In some cases these algorithms include the effects of interactions with other measures or end.

For “custom” measures, Hawaii Energy performs site-specific customized calculations. In this case, Hawaii Energy takes into account interactions between measures (e.g., individual savings from installation of window film and replacement of a chiller are not additive because the first measure reduces the cooling load met by the second measure).

Hawaii Energy will calculate total savings for the package of custom measures being installed, considering interactive effects, either as a single package or in rank order of measures as described below.

If a project includes both prescriptive and custom measures, the prescriptive measures will be calculated in the normal manner. However, the prescriptive measures will be assumed to be installed prior to determining the impacts for the custom measures.

For commercial lighting measures, the following factors are applied for facilities with air conditioning.

Table 3.1

| Building Type | Expected Level of Similarity | Energy Factor | Demand Factor |
|----------------------|-------------------------------------|----------------------|----------------------|
| All Commercial | Low | 1.056 | 1.075 |
| Misc Commercial | Low | 1.056 | 1.075 |
| Cold Storage | Very High | 1.423 | 1.22 |
| Education | Low | 1.061 | 1.039 |
| Grocery | Low | 1.043 | 1.114 |
| Health | High | 1.122 | 1.233 |
| Hotel/Motel | High | 1.115 | 1.236 |
| Industrial | Low | 1.043 | 1.074 |
| Office | Low | 1.068 | 1.102 |
| Restaurant | Low | 1.051 | 1.073 |
| Retail | Low | 1.054 | 1.085 |
| Warehouse | Low | 1.019 | 1.053 |

4 Persistence

Persistence factors may be used to reduce lifetime measure savings in recognition that initial engineering estimates of annual savings may not persist long term.

This might be because a measure is removed or stops functioning prior to the end of its normal engineering lifetime, because it is not properly maintained, it is overridden, it goes out of calibration (controls only), or for some other reason.

Some of the measure algorithm may contain an entry for persistence factor. The default value if none is indicated is 1.00 (100%). A value lower than 1.00 will result in a downward adjustment of lifetime savings and total resource benefits.

For any measure with a persistence value less than 1.00, the claimed first year savings are reduced, and claimed for each year of the equipment's expected useful life for the purposes of estimating the TRB of a measure or program.

5 Glossary

The following glossary provides definitions for necessary assumptions needed to calculate measure savings.

Attribution Factor (AF): The Attribution Factor is the amount of savings attributable to the program impact. It is calculated by subtracting from one the % free ridership.

Baseline Efficiency (η_{base}): The assumed standard efficiency of equipment, absent an Hawaii Energy program.

Coincidence Factor (CF): Coincidence factors represent the fraction of connected load expected to be “on” and using electricity coincident with the system peak period.

Connected Load: The maximum wattage of the equipment, under normal operating conditions, when the equipment is “on”.

Freeridership (FR): A program’s **free ridership rate** is the percentage of program participants deemed to be free riders. A **free rider** refers to a customer who received an incentive through an energy efficiency program who would have installed the same or a smaller quantity of the same high efficiency measure on their own within one year if the program had not been offered.

Full Load Hours (FLH): The equivalent hours that equipment would need to operate at its peak capacity in order to consume its estimated annual kWh consumption (annual kWh/connected kW).

High Efficiency (η_{effic}): The efficiency of the energy-saving equipment installed as a result of an efficiency program.

Incremental Cost: The cost difference between the installed cost of the high efficiency measure and the standard efficiency measure.

Lifetimes: The number of years (or hours) that the new high efficiency equipment is expected to function. These are generally based on engineering lives, but sometimes adjusted based on expectations about frequency of remodeling or demolition.

System Loss Factor (SLF): The marginal electricity losses from the generator to the customer meter – expressed as a percent of meter-level savings. The Energy Line Loss Factors vary by period. The Peak Line Loss Factors reflect losses at the time of system peak, and are shown for two seasons of the year (winter and summer). Line loss factors are the same for all measures.

Load Factor (LF): The fraction of full load (wattage) for which the equipment is typically run.

Operating Hours (HOURS): The annual hours that equipment is expected to operate.

Persistence (PF): The fraction of gross measure savings obtained over the measure life.

Realization Rate (RR): The fraction of gross measure savings realized by the program impact. It includes the gross verification adjustment and free ridership or attribution adjustment.

Spillover (SPL): Spillover refers to energy-efficient equipment installed in any facility in the program service area due to program influences, but without any financial or technical assistance from the Program. It is expressed as a percent or fraction of the gross savings attributable to program participation.

Total Resource Benefits (TRB): The present value of benefits from the program savings resulting from avoided energy and capacity costs for the utility and their ratepayers.

6 Load shapes and Demand Coincidence Factors

Load shapes for different types of equipment or systems were not needed because the savings values estimated in the KEMA 2008 impact evaluation already accounted for these load shapes. The coincidence factors were developed based on the calculated full load demand reduction and the KEMA values for each building type. The resulting coincidence factors were evaluated for reasonableness depending on the system type and the building type.

7 Total Resource Benefits – Avoided Costs and Measure Life

Table 7.1

| Hawaii Energy - PY2013 ANNUAL PLAN | | | | | | | | |
|-------------------------------------|--------|---------------|------------------------|-----------|-------------------|-----------|--------------------------------|-----------|
| Proposed TRB Utility Benefit Values | | | | | | | | |

| 2020 | 8 | 0.67 | \$ | 390.7 | \$ 0.115 | \$ 260 | \$ 0.0763 | \$ 2,502 |
| 2021 | 9 | 0.63 | \$ | 394.6 | \$ 0.116 | \$ 248 | \$ 0.0727 | \$ 2,749 |
| 2022 | 10 | 0.59 | \$ | 398.3 | \$ 0.117 | \$ 236 | \$ 0.0693 | \$ 2,985 |
| 2023 | 11 | 0.56 | \$ | 397.4 | \$ 0.117 | \$ 222 | \$ 0.0652 | \$ 3,207 |
| 2024 | 12 | 0.53 | \$ | 401.4 | \$ 0.118 | \$ 211 | \$ 0.0621 | \$ 3,418 |
| 2025 | 13 | 0.50 | \$ | 405.7 | \$ 0.119 | \$ 202 | \$ 0.0592 | \$ 3,620 |
| 2026 | 14 | 0.47 | \$ | 409.3 | \$ 0.120 | \$ 192 | \$ 0.0564 | \$ 3,812 |
| 2027 | 15 | 0.44 | \$ | 415.9 | \$ 0.122 | \$ 184 | \$ 0.0540 | \$ 3,996 |
| 2028 | 16 | 0.42 | \$ | 423.3 | \$ 0.124 | \$ 177 | \$ 0.0519 | \$ 4,172 |
| 2029 | 17 | 0.39 | \$ | 428.9 | \$ 0.126 | \$ 169 | \$ 0.0496 | \$ 4,341 |
| 2030 | 18 | 0.37 | \$ | 433.9 | \$ 0.128 | \$ 161 | \$ 0.0475 | \$ 4,502 |
| 2031 | 19 | 0.35 | \$ | 438.9 | \$ 0.130 | \$ 154 | \$ 0.0455 | \$ 4,656 |
| 2032 | 20 | 0.33 | \$ | 443.9 | \$ 0.132 | \$ 147 | \$ 0.0436 | \$ 4,803 |

This table was deemed a good estimate of actual avoided energy and capacity costs as it was more in line with the avoided costs used in many other programs. Therefore, these avoided costs are used to calculate the Total Resource Benefits for PY13.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Effective Useful Life (EUL): Table 7.2

Version Date & Revision History

Draft date: July 1, 2013

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents: Econorthwest TRM Review – 6/23/10
DEER (The Database for Energy Efficient Resources) – 10/1/08

TRM Review Actions:

- 6/23/10 Rec. – Adopt DEER values in those cases where there is a greater than 20 percent difference between DEER and current TRM. – Adopted

Major Changes:

- Hawaii Energy will adopt DEER EUI values across the board and will follow DEER changes as they are updated unless obvious differences for Hawaii applications are identified.

The measure Effective Useful Life estimated for each measure is shown in the following table:

Hawaii Energy - Technical Reference Manual No. 2013

8 (REEM) Residential Energy Efficiency Measures

8.1 High Efficiency Water Heating

8.1.1 Solar Water Heater

Version Date & Revision History

Draft date: February 24, 2010

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Energy and Peak Demand Impact Evaluation Report of the 2005-2007 Demand Management Programs – (KEMA 2005-07)
- Econorthwest TRM Review – 6/23/10
- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 6/23/10 Rec. # 6 – For PY 2010, adjust claimed demand savings based on participant data from all service territories covered. Adjust Demand Savings based on participant data weighted average of KEMA results across all counties. Change from 0.50 to 0.46 kW. non-military – Adopted and incorporated into PY2010-1 TRM.
- 6/23/10 Rec. # 7 - For PY 2010, include a discussion of shell losses in the savings analysis and supporting documentation. Discussion included in PY2010-1 TRM.
- 10/5/11 – Currently Under Review.

Major Changes:

- Eliminated Military figure as no foreseeable military retrofit applications will be received.
- Demand change to weighted average from KEMA 2008. 0.46 kW
- Changed individual water usage from 13.3035 to 13.3

Measure Description:

Replacement of Electric Resistance Water Heater with a Solar Water Heater designed for a 90% Solar Fraction. The new Solar Water Heating systems most often include an upgrade of the hot water storage tank sized at 80 or 120 gallons.

Systems must comply with Hawaii Energy Solar Standards and Specifications which call out:

- Panel Ratings
- System Sizing
- Installation orientation de-rating factors
- Hardware and mounting systems

Shell Losses:

The increase in size from a 40 or 60 gallon to an 80 or 120 gallon standard electric resistance water heater would in and of itself increase the “shell” losses of the system. These shell losses are the result of a larger surface area exposing the warm water to the cooler environment and thus more heat lost to the environment through conduction through the tank. Engineering calculations by Econorthwest puts this at a 1% increase in losses. This is further reduced by 90% as the solar water system provides that fraction of the annual water heating requirements.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Baseline Efficiencies:

Baseline usage is a 0.9 COP Electric Resistance Water Heater. The baseline water heater energy consumption is by a single 4.0kW electric resistance element that is controlled thermostatically on/off controller based of tank finish temperature set point. The tank standby loss differences between baseline and high efficiency case are assumed to be negligible.

Demand Baseline has been determined by field measurements by KEMA 2005-07 report. The energy baseline also comes from the KEMA 2005-07 report and is supported by engineering calculations shown in this TRM.

| Building Types | Demand Baseline(kW) | Energy Baseline (kWh) |
|----------------|---------------------|-----------------------|
| Residential | 0.57 | 2,733 |

High Efficiency:

Solar Water Heater designed for a 90% Solar Fraction. The Solar Systems use solar thermal energy to heat the water 90% of the time and continue to utilize electricity to operate the circulation pump and provide heating through a 4.0 kW electric resistance element when needed.

Solar Contractors do not favor Photo-Voltaic powered DC circulation pumps as they have proven less reliable in the field than an AC powered circulation pump.

The electric resistance elements in the high efficiency case do not have load control timers on them.

The energy is the design energy of a 90% solar fraction system with circulation pump usage as metered by KEMA 2008.

The on peak demand is the metered demand found by KEMA 2008.

| Building Types | Demand High Efficiency (kW) | Energy High Efficiency (kWh) | Circ. Pump % |
|----------------|-----------------------------|------------------------------|--------------|
| Residential | 0.07 | 379 | 28% |

Energy Savings:

Solar Water Heater Gross Savings before operational adjustments:

| Building Types | Demand Savings (kW) | Energy Savings (kWh) |
|----------------|---------------------|----------------------|
| Residential | 0.46 | 2,354 |

| Operational Factor | Adjustment Factor |
|----------------------------------|-------------------|
| Solar Fraction Performance (sfp) | 0.94 |
| Persistence Factor (pf) | 0.93 |
| Demand Coincidence Factor (cf) | 1.0 |

Solar Water Heater Net Savings after operational adjustments:

| Building Types | Demand Savings (kW) | Energy Savings (kWh) |
|----------------|---------------------|----------------------|
| Residential | 0.46 | 2,065 |

TRM Review Actions:

- 6/23/10 Rec. # 6 – For PY 2010, adjust claimed demand savings based on participant data from all service territories covered. Adjust Demand Savings based on participant data weighted average of KEMA results across all counties. Change from 0.50 to 0.46 kW. non-military – Adopted and incorporated into PY2010-1 TRM.
- 6/23/10 Rec. # 7 - For PY 2010, include a discussion of shell losses in the savings analysis and supporting documentation. Discussion included in PY2010-1 TRM.
- 10/5/11 – Currently Under Review.

Major Changes:

- Eliminated Military figure as no foreseeable military retrofit applications will be received.
- Demand change to weighted average from KEMA 2008. 0.46 kW
- Changed individual water usage from 13.3035 to 13.3
- 11/14/13 – Included peak demand savings calculations.

Measure Description:

The Solar Water Heating Loan Interest Buydown Program offers eligible borrowers an interest buy down of \$1,000 (with a minimum loan of \$5,000) toward the financing of a solar water heating system from a participating lender – see www.hawaiienergy.com for a list of participating lenders.

Replacement of Electric Resistance Water Heater with a Solar Water Heater designed for a 90% Solar Fraction. The new Solar Water Heating systems most often include an upgrade of the hot water storage tank sized at 80 or 120 gallons.

Systems must comply with Hawaii Energy Solar Standards and Specifications which call out:

- Panel Ratings
- System Sizing
- Installation orientation de-rating factors
- Hardware and mounting systems

Shell Losses:

The increase in size from a 40 or 60 gallon to an 80 or 120 gallon standard electric resistance water heater would in and of itself increase the “shell” losses of the system. These shell losses are the result of a larger surface area exposing the warm water to the cooler environment and thus more heat lost to the environment through conduction through the tank. Engineering calculations by Econorthwest puts this at a 1% increase in losses. This is further reduced by 90% as the solar water system provides that fraction of the annual water heating requirements.

8.1.3 Solar Water Heater Energy Hero Gift Packs

Version Date & Revision History

Draft date: October 4, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Energy and Peak Demand Impact Evaluation Report of the 2005-2007
- Demand Management Programs – KEMA (KEMA 2005-07)
- Econorthwest TRM Review – 6/23/10
- Energy and Peak Demand Impact Evaluation Report of the 2005-2007 Demand Management Programs – (KEMA 2005-07)
- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- 11/22/11 – LED algorithm updated. See section 8.2.2 for changes.
- 11/22/11 – Akamai Power Strip kWh savings updated based on NYSERDA Measure Characterization for Advanced Power Strips.
- 11/22/11 – Updated content in headings *Description*, *Base Case*, *High Efficiency Case*, and *Energy Savings* in regard to LED lamps to match section 8.2.2.
- 11/29/11 – Low Flow Shower Head algorithm updated – previously claiming only 50% of total energy savings due to inaccurately calculating hot and cold water mix. Also updated *Energy Savings* table as necessary.
- 4/17/12 – Updated CFL and LED algorithms to refer to CFL and LED sections in TRM to ensure accuracy. Updated energy savings numbers to be consistent with EMV revisions.
- 8/1/12 – Updated Low Flow Shower Head algorithm to reduce demand savings from 40% to 20% as per EM&V review (Feb. 2012)
- 11/14/13 – Included type and quantity of peripherals in the power strip calculation with Hawaii specific data. Adjusted demand savings for low flow showerhead.

Description:

Potential gift pack components:

- Compact Fluorescent Lamp
- Akamai Power Strip
- LED Lamp
- Low Flow Shower Head

Base Case

- 60 W incandescent lamps
- Standard power strip or no power strip
- 25% 60W incandescent, 25% 40W incandescent, 25% 23W CFLs and 25% 13W CFLs (See LED TRM)
- Low Flow Shower Head rated at 2.5 gpm

High Efficiency Case

- 15W CFLs
- Akamai Power Strip
- 50% 7W LED Lamp and 50% 12.5W LED Lamp
- Low Flow Shower Head rated at 1.5 gpm

8.1.4 Heat Pump Water Heaters

Measure ID: See Table 7.3

Version Date & Revision History

Draft date: March 2, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- From Salesforce Measures (Impact)
- October 2004 (KEMA Report)
- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 10/5/11 – Currently Under Review.
- 11/14/13 – Adjusted savings to be consistent with the most recent product specifications.

Major Changes:

- Recognizing the growing product availability and sales efforts regarding residential heat pumps, increase educational efforts.
- Changed base SERWH element power consumption from 4.5 kW to 4.0 kW

Measure Description:

Residential heat pump rebates are available at \$175. Rebate applications for water heaters are provided by the retailers at the time of purchase or a customer can visit our website and download the form. Rebate applications must include an original purchase receipt showing brand and model number.

Baseline Efficiencies:

The base case is a standard electric resistance water heater (SERWH).

| Measure | Demand Baseline (kW) | Energy Baseline (kWh/year) |
|---------|----------------------|----------------------------|
| SERWH | 0.57 | 2,732 |

High Efficiency:

| Measure | Demand Efficient Case (kW) | Efficient Case (kWh/year) |

8.2.1 Compact Fluorescent Lamp (CFL)

Version Date & Revision History

Draft date: February 24, 2010

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Energy and Peak Demand Impact Evaluation Report of the 2005-2007
- Demand Management Programs – KEMA (KEMA 2005-07)
- Econorthwest TRM Review – 6/23/10
- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 6/23/10 Rec. # 8 – Starting with PY2010, adjust the hours used per day for CFLs from 4.98 to 2.3 in order to be consistent with other literature. Conduct additional research to verify the most appropriate hours of operation for the Hawaii customer base, which can be incorporated into future years. – Adopted.
- 6/23/10 Rec. # 9 - Starting with PY 2010, adjust the peak coincidence factor from 0.334 to 0.12 to be consistent with the literature. Conduct additional research to verify the most appropriate coincidence factor for the Hawaii customer base, which can be incorporated into future years.- Adopted.
- 10/5/11 – Currently Under Review.
- 4/17/12 – Updated persistence factor to 0.96 and removed adjustment for mix of CFL sizes found in CA study as per EMV report February 23, 2012. Updated energy and demand savings accordingly.

Major Changes:

- Hours used per day for CFLs from 4.98 to 2.3 hrs.
- Peak coincidence factor from 0.334 to 0.12
- Persistence factor changed from 0.80 to 0.96 as per EMV
- Adjustment for mix of CFL sized found in CA study removed as per EMV

Measure Description:

The replacement of incandescent screw-in lamps to standard spiral compact fluorescent lamps in Residential Single Family and Multi-family homes.

Lamps must comply with:

- Energy Star
- UL

Baseline Efficiencies:

Baseline usage is a 60W A-Shaped incandescent lamp with the energy consumption as follows:

| Building Types | Demand Baseline(kW) | Energy Baseline (kWh) |
|----------------|---------------------|-----------------------|
| Single Family | 0.056 | 50.4 |
| Multi Family | 0.056 | 50.4 |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

High Efficiency:

The high efficiency case is a 15W Spiral CFL with the energy consumption as follows:

| Building Types | Demand High Efficiency (kW) | Energy High Efficiency (kWh) |
|----------------|-----------------------------|------------------------------|
| Single Family | 0.015 | 12.6 |
| Multi Family | 0.015 | 12.6 |

Energy Savings:

CFL Gross Savings before operational adjustments:

| Building Types | Demand Savings (kW) | Energy Savings (kWh) |
|----------------|---------------------|----------------------|
| Single Family | 0.005 | 36.3 |
| Multi Family | 0.005 | 36.3 |

CFL Net Savings after operational adjustments:

| Operational Factor | Adjustment Factor |
|--------------------------------|-------------------|
| Persistence Factor (pf) | 0.960 |
| Demand Coincidence Factor (cf) | 0.12 |

| Building Types | Demand Savings (kW) | Energy Savings (kWh) |
|----------------|---------------------|----------------------|
| Single Family | 0.005 | 36.3 |
| Multi Family | 0.005 | 36.3 |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

None

8.2.2 Light Emitting Diode (LED)

Version Date & Revision History

Draft date: February 24, 2010

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- 11/21/11 – Updated tables and text in the following headings:
 - Measure description
 - Baseline efficiencies
 - High efficiency
 - Energy savings
 - Savings algorithm

Updates made to capture a broader range of lamp types (two wattages per lamp type) and obtain more accurate savings calculations.

- 11/21/11 – Changed the following text under *Energy Savings* heading: 1) “LED Gross Savings before operational adjustments” was changed to “LED Savings before...” and 2) “CFL Net Savings after operational adjustments” was changed to “LED Savings after...”
- 11/21/11 – Under *Energy Savings* heading changed table to only one building type because savings are calculated the same between single and multi-family housing.
- Removed the 1.08 size adjustment factor.

Measure Description:

The replacement of a standard incandescent lamp (40W or 60W) or spiral compact fluorescent lamp (13W or 23W) with a light emitting diode (7W or 12.5 W) in both Residential Single Family and Multi-family homes.

Lamps must comply with:

- Energy Star
- UL

Baseline Efficiencies:

Baseline usage is a combination of standard incandescent lamp (40W or 60W) or spiral compact fluorescent lamp (15W or 23W) A-Shaped incandescent lamp with the energy consumption as follows:

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

| Baseline Efficiency | | | | | |

8.3 High Efficiency Air Conditioning

8.3.1 VRF Split System AC

Version Date & Revision History

Draft date: February 24, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- n/a

Description: Inverter driven variable refrigerant flow (VRF) air conditioning systems are direct expansion AC systems that utilize variable speed evaporator/condenser fans, and a combination of fixed and variable speed compressors along with most often multiple individual zone evaporators to provide the ability to more closely match the AC system's output with the building's cooling requirements.

Savings comes from:

- *Part Load Efficiencies:* Increased part-load efficiency operation
- *High Efficiency Motors:* Many systems use ECM motors
- *Higher Room Temperatures:* The capacity matching allows for better humidity control through longer cooling operation.
- *Reduction of Distribution Losses:* Duct losses are reduced with DX systems. This may be offset by dedicated outside air distribution systems when needed.

Payback Qualifications: VRF products need a payback requirement of 1 year or greater. The TRB/TRC must be greater than 1.

Energy and Demand Savings: VRF systems have demonstrated a 20-30% reduction in energy consumption as compared to standard DX equipment. The energy savings and demand tables that follow provide the savings by building type and system size for VRF systems.

The VRF applications have been new construction projects with no ability to perform pre and post measurements. Hawaii Energy will perform field pre and post field measurements to determine the measure effectiveness in the local environment

8.3.2 Ceiling Fans

Version Date & Revision History

Draft date: March 2, 2011
Effective date: July 1, 2013
End date: June 30, 2014

Referenced Documents:

- ENERGY STAR Ceiling Fan Savings Calculator

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- Reduced fan lighting hours of operation from 3.5 hours to 2.3 hours per day to be consistent with the other lighting measures – EM&V Review November 14, 2013

Measure Description:

This measure describes the instillation of an ENERGY STAR ceiling fan that uses a high efficiency motor and contains compact fluorescent bulbs in place of a standard fan with integral incandescent bulbs.

Baseline Efficiencies:

The baseline equipment is assumed to be a standard fan with integral incandescent bulbs.

High Efficiency:

The efficient equipment must be an ENERGY STAR certified ceiling fan with integral CFL bulbs.

Energy Savings:

| | Average Annual kWh savings per unit | Average Coincident Peak kW savings per unit |
|-------------|--|--|
| 2010 - 2013 | 110 | 0.019 |
| 2014 on | 65 | 0.012 |

$$\Delta \text{kWh} = ((\%_{\text{low}} * (\text{LowKW}_{\text{base}} - \text{LowKW}_{\text{ee}}) + \%_{\text{med}} * (\text{MedKW}_{\text{base}} - \text{MedKW}_{\text{ee}}) + \%_{\text{high}} * (\text{HighKW}_{\text{base}} - \text{HighKW}_{\text{ee}})) * \text{HOURS}_{\text{fan}}) + ((\text{IncKW} - \text{CFLKW}) * \text{HOURS}_{\text{light}} * \text{WHFe})$$

Where:

| | | |
|---------------------------------|--|--------------|
| $\%_{\text{low}}$ | = Percent of time on Low Speed | = 40% |
| $\%_{\text{med}}$ | = Percent of time on Medium Speed | = 40% |
| $\%_{\text{high}}$ | = Percent of time on High Speed | = 20% |
| $\text{LowWatt}_{\text{base}}$ | = Low speed baseline ceiling fan wattage | = 0.0152 kW |
| $\text{LowWatt}_{\text{ee}}$ | = Low speed ENERGY STAR ceiling fan wattage | = 0.0117 kW |
| $\text{MedWatt}_{\text{base}}$ | = Medium speed baseline ceiling fan wattage | = 0.0348 kW |
| $\text{MedWatt}_{\text{ee}}$ | = Medium speed ENERGY STAR ceiling fan wattage | = 0.0314 kW |
| $\text{HighWatt}_{\text{base}}$ | = High speed baseline ceiling fan wattage | = 0.0725 kW |
| $\text{HighWatt}_{\text{ee}}$ | = High speed ENERGY STAR ceiling fan wattage | = 0.0715 kW |
| $\text{HOURS}_{\text{fan}}$ | = Typical fan operating hours (2.8/day, 365 days per year) | = 1022 hours |
| IncWatt | = Incandescent bulb kW (assumes 3 * 60W bulb) | = 0.180kW |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

$$\begin{aligned}
 \text{CFLWatt} &= \text{CFL bulb kW (assumes 3 * 20W bulb)} &= 0.060\text{kW} \\
 \text{HOURS}_{\text{light}} &= \text{Typical lighting operating hours (2.3/day, 365 days per year)} &= 839.5 \text{ hours} \\
 \text{WHFe} &= \text{Waste Heat Factor for Energy to account for cooling savings from Efficient lighting.} &= 1.07 \\
 \\
 \Delta\text{kWh} &= ((0.4 * (0.0152 - 0.0117) + 0.4 * (0.0348 - 0.0314) + 0.2 * (0.0725 - 0.0715)) \\
 &\quad * 1022) + ((0.18 - 0.06) * 839.5 * 1.07) \\
 &= \mathbf{110 \text{ kWh}}
 \end{aligned}$$

Baseline Adjustment

Federal legislation stemming from the Energy Independence and Security Act of 2007 will require all general-purpose light bulbs between 40 and 100W to be approximately 30% more energy efficient than current incandescent bulbs, in essence beginning the phase out of standard incandescent bulbs. In 2012 100W incandescents will no longer be manufactured, followed by restrictions on 75W in 2013 and 60W in 2014. The baseline for this measure will therefore become bulbs (improved incandescent or halogen) that meet the new standard. To account for these new standards, first year annual savings for this measure must be reduced beginning in 2014. This measure assumes 60W baseline bulbs, which in 2014 will become 43W and so the annual savings beginning in 2014 should therefore be:

$$\begin{aligned}
 \Delta\text{kWh} &= ((0.4 * (0.0152 - 0.0117) + 0.4 * (0.0348 - 0.0314) + 0.2 * (0.0725 - 0.0715)) \\
 &\quad * 1022) + ((0.129 - 0.06) * 839.5 * 1.07) \\
 &= \mathbf{65 \text{ kWh}}
 \end{aligned}$$

In addition, since during the lifetime of a CFL, the baseline incandescent bulb will be replaced multiple times, the annual savings claim must be reduced within the life of the measure. Therefore, for bulbs installed in 2010, the full savings (110 kWh) should be claimed for the first four years, but the reduced annual savings (65 kWh) claimed for the remainder of the measure life. The savings adjustment is therefore equal to $65/110 = 59\%$.

Coincident Peak Demand Savings

$$\Delta\text{kW} = (\%_{\text{low}} * (\text{LowKW}_{\text{base}} - \text{LowKW}_{\text{wee}}) + \%_{\text{med}} * (\text{MedKW}_{\text{base}} - \text{MedKW}_{\text{wee}}) + \%_{\text{high}} * (\text{HighKW}_{\text{base}} - \text{HighKW}_{\text{wee}})) + ((\text{InckW} - \text{CFLKW}) * \text{WHFd}) * \text{CF}$$

Where:

$$\begin{aligned}
 \text{WHFd} &= \text{Waste Heat Factor for Demand to account for cooling savings from efficient lighting} \\
 &= 1.21
 \end{aligned}$$

$$\begin{aligned}
 \text{CF} &= \text{Peak Coincidence Factor for measure} \\
 &= 0.11
 \end{aligned}$$

$$\begin{aligned}
 \Delta\text{kW} &= ((0.4 * (0.0152 - 0.0117) + 0.4 * (0.0348 - 0.0314) + 0.2 * (0.0725 - 0.0715)) \\
 &\quad + ((0.18 - 0.06) * 1.21) * 0.11
 \end{aligned}$$

$$\Delta\text{kW} = \mathbf{0.019\text{kW}}$$

After 2014, this will be reduced to:

$$\begin{aligned}
 \Delta\text{kW} &= ((0.4 * (0.0152 - 0.0117) + 0.4 * (0.0348 - 0.0314) + 0.2 * (0.0725 - 0.0715)) \\
 &\quad + ((0.129 - 0.06) * 1.21) * 0.11
 \end{aligned}$$

$$\Delta\text{kW} = \mathbf{0.012\text{kW}}$$

8.3.3 Solar Attic Fans

Version Date & Revision History

Draft date: March 2, 2011
Effective date: July 1, 2013
End date: June 30, 2014

Referenced Documents:

- n/a

TRM Review Actions:

- November 14, 2013 – Conduct additional research to ensure the 10% air conditioning savings estimate is reasonable. This could include some metering or bill history analysis of customers who participated in this measure. This is a low priority research task as participation for this measure was small during the last program year.

Major Changes:

- n/a

Measure Description: Solar attic fan is assumed to reduce 10% of existing air conditioning load energy usage and no demand reduction from 5PM – 9PM.

Baseline Efficiencies:

The baseline case is no solar attic fan.

| Base Case | Demand Baseline (kW) | Energy Baseline (kWh/year) |
|--------------------|-------------------------------------|---|
| No Solar Attic Fan | 1.00 | 5,016 |

High Efficiency:

| High Efficiency Case | Efficient Case (kW) | Efficient Case (kWh/year) |
|-----------------------------|------------------------------------|--|
| Solar Attic Fan | 1.00 | 4,514 |

8.4 High Efficiency Appliances

8.4.1 ENERGY STAR Refrigerator and Clothes Washer

Version Date & Revision History

Draft date: February 24, 2010

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- HECO DSM Docket – Backup Worksheets - Global Energy (07-14-06)
- Econorthwest TRM Review – 6/23/10
- Department of Energy Refrigerator Profile – Updated December 2009

TRM Review Actions:

- 6/23/10 Rec. # 11 – Revise savings to be consistent with ENERGY STAR estimates. – Adopted with modifications on refrigerator figures based on DOE Refrigerator profile and the addition of bounty, recycle with new figures.
- 6/23/10 Rec. # 12 – Split the claimed savings by appliance. – Adopted.
- 6/23/10 Rec. # 13 – Incorporate solar hot water heating into appliance savings values – Adopted.
- 6/23/10 Rec. # 14 – Revise demand savings values for ENERGY STAR appliances – Adopted.
- 10/4/11 – Removed dishwashers from appliance list.
- 4/9/12 – Baseline efficiency for non-ES Refrigerator changed from 537 to 540. Number changed to match ES data.
- 11/14/13 – Updated Energy Star clothes washer to be consistent with the most recent Energy Star standards and calculations.
- 11/14/13 – New standards will take effect beginning September 15, 2014.

Major Changes:

- Split between ESH appliances
- Incorporation of three refrigerator categories (new, new with turn in, and bounty (turn in only))
- All ESH 313 kWh and 0.12 kW changed to:

| | |
|--------------------------------------|------------------|
| ○ New ES Refrigerator Only – | 105 kWh, .017 kW |
| ○ New ES Refrigerator with Turn-In – | 822 kWh, .034 kW |
| ○ Bounty (Turn in only) – | 859 kWh, .034 kW |
| ○ Washing Machine – | 206 kWh, .028 kW |

Measure Description:

The replacement of standard Clothes Washers and Refrigerators in Residential Single Family and Multi-family homes.

Appliances must comply with:

- Energy Star

Refrigerators – ENERGY STAR refrigerators utilize improvements in insulation and compressors.

Clothes Washers – Clothes washers that meet ENERGY STAR criteria use next generation technology to cut energy and water consumption by over 40% compared to conventional washers. Clothes washers come in either front-load or redesigned top-load designs. Both configurations include technical innovations that help save substantial amounts of energy and water.

- **No Central Agitator** Front-loaders tumble clothes through a small amount of water instead of rubbing clothes against an agitator in a full tub. Advanced top loaders use sophisticated wash

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

systems to flip or spin clothes through a reduced stream of water. Both designs dramatically reduce the amount of hot water used in the wash cycle, and the energy used to heat it.

- **High Spin Speeds** Efficient motors spin clothes two to three times faster during the spin cycle to extract more water. Less moisture in the clothes means less time and energy in the dryer.

Baseline Efficiencies:

Baseline energy usage based on 2009 Energy Star Information for the appliances are as follows:

| | Demand Baseline (kW) | Energy Baseline (kWh) | Notes |
|----------------------------------|----------------------------|--------------------------|-----------------------|
| Non ES Qualifying Refrigerator | | 540 | 19.0-21.4 Top Freezer |
| Non ES Qualifying Clothes Washer | | 966 | 392 Loads per Year |

High Efficiency:

The high efficiency case Energy Star energy usage based on 2009 Energy Star Calculator Information and DOE Refrigerator Market Profile for the appliances is as follows:

| | Demand High Efficiency (kW) | Energy High Efficiency (kWh) | Notes |
|------------------------------|--------------------------------------|------------------------------------|-----------------------|
| ES Qualifying Refrigerator | | 435 | 19.0-21.4 Top Freezer |
| ES Qualifying Clothes Washer | | 609 | 392 Loads per Year |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Energy Savings:

Energy Star Appliance Gross Savings before operational adjustments:

| | Demand Savings (kW) | Energy Savings (kWh) |
|------------------------------|----------------------------|-----------------------------|
| ES Refrigerator | 0.017 | 105 |
| ES Refrigerator with Turn-In | 0.034 | 822 |

Table 1

Energy Savings Opportunities for Program Sponsors

| Opportunity | Annual Savings | | | |
|--|----------------|-------|--------------------------|------------|
| | Per Unit | | Aggregate U.S. Potential | |
| | kWh | \$ | MWh | \$ million |
| 1. Increase the number of buyers that purchase ENERGY STAR qualified refrigerators. <ul style="list-style-type: none"> 9.3 million units were sold in 2008. 70 percent were not ENERGY STAR. 6.5 million potential units per year could be upgraded. | 105 | 11.64 | 675,928 | 75 |
| 2. Decrease the number of units kept on the grid when new units are purchased. <ul style="list-style-type: none"> 8.7 million primary units were replaced in 2008. 44 percent remained in use, whether they were converted to second units, sold, or given away. 3.8 million units are candidates for retirement every year. | 717 | 79.53 | 2,746,062 | 305 |
| 3. Decrease the number of second units. <ul style="list-style-type: none"> 26 percent of households had a second refrigerator in 2008. 29.6 million units are candidates for retirement. | 859 | 95.28 | 25,442,156 | 2,822 |
| 4. Replace pre-1993 units with new ENERGY STAR qualified models. <ul style="list-style-type: none"> 19 percent of all units in use in 2008 were manufactured before 1993. 27.3 million total potential units are candidates for targeted replacement. | 730 | 81 | 19,946,440 | 2,212 |

Sources: See endnote 10.

Table 2

Energy and Cost Comparison for Upgrading to ENERGY STAR

| Purchase Decision | New Non-ENERGY STAR Qualified Refrigerator | New ENERGY STAR Qualified Refrigerator |
|-----------------------|--|--|
| Annual Consumption | 540 kWh | 435 kWh |
| | \$60 | \$48 |
| Annual Savings | – | 105 kWh |
| | – | \$12 |
| Average Lifetime | 12 years | 12 years |
| Lifetime Savings | – | 1,260 kWh |
| | – | \$140 |
| Price Premium | – | \$30 - \$100 |
| Simple Payback Period | – | 3-9 years |

Note: Calculations based on shipment-weighted average annual energy consumption of 2008 models. An ENERGY STAR qualified model uses 20 percent less energy than a new non-qualified refrigerator of the same size and configuration.

Source: See endnote 10.

Table 3

Energy and Cost Comparison for Removing a Second Refrigerator from the Grid

| Fate of Unit | Post-1993 Unit | | Pre-1993 Unit | |
|-----------------------|---------------------|-----------------------|---------------------|-----------------------|
| | Remains on the Grid | Removed from the Grid | Remains on the Grid | Removed from the Grid |
| Annual Consumption | 640 kWh | – | 1,131 kWh | – |
| | \$71 | – | \$125 | – |
| Annual Savings | – | 640 kWh | – | 1,131 kWh |
| | – | \$71 | – | \$125 |
| Average Lifetime* | 6 | – | 6 | – |
| Lifetime Savings* | – | 3,840 kWh | – | 6,788 kWh |
| | – | \$426 | – | \$753 |
| Removal Cost | – | \$50 - \$100 | – | \$50 - \$100 |
| Simple Payback Period | – | 1-2 years | – | <1 year |

*Assumes unit has six years of functionality remaining.

8.4.2 Pool VFD Controller Pumps

Version Date & Revision History

Draft date: February 24, 2010

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Davis Energy Group (2008). Proposal Information Template for Residential Pool Pump Measure Revisions. Prepared for Pacific Gas and Electric Company; Page 2.
- Residential Retrofit High Impact Measure Evaluation Report. The Cadmus Group. February 8, 2010.

TRM Review Actions:

- 4/9/12 – Measure updated per EMV report February 23, 2012. Coincidence Factor of .0862 added. Added algorithm for Evergreen with 4.25 hours in place of 6 hours per day. Added Cadmus Group reference.
- 10/5/11 – Currently Under Review.
- 11/14/13 – No changes are recommended.

Major Changes:

- n/a

Measure Description

A variable speed residential pool pump motor in place of a standard single speed motor of equivalent horsepower.

Definition of Efficient Equipment

The high efficiency equipment is a variable speed residential pool pump.

Definition of Baseline Equipment

The baseline efficiency equipment is assumed to be a single speed residential pool pump.

$$\Delta \text{kWh} = (\text{kWBASE} \times \text{Hours}) \times 55\% \text{ BASE}$$

Where:

| | |
|---------------------|---|
| Unit | = variable speed pool pump |
| ΔkWh | = Average annual kWh reduction |
| Hours | = Average annual operating hours of pump |
| kWBASE | = connected kW of baseline pump |
| 55% | = average percent energy reduction (Davis Energy Group, 2008) |

Baseline Efficiency

The baseline efficiency case is a single speed pump.

| | |
|----------------------------|---------------|
| Based Demand | 0.70 kW |
| Base Energy Usage per day | 2.97 kWh/day |
| Base Energy Usage per year | 1085 kWh/year |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

High Efficiency

The high efficiency case is variable speed pump.

| | |
|------------------------------|--------------|
| Demand Reduction | 10% |
| High Efficiency Demand | 0.63 kW |
| Energy Savings | 55% |
| High Efficiency Energy Usage | 488 kWh/year |

Energy and Demand Savings

| | |
|--------------------|-----------|
| Demand Savings | 1.278 kW |
| Coincidence Factor | 0.0862 kW |

| | |
|-------------------------|--------------|
| Energy Savings per year | 597 kWh/year |
| Peak Demand Reduction | 0.006 kW |

Savings Algorithm

| | |
|------------------------------|-------------------|
| Average Pool Pump Horsepower | 0.75 HP |
| Efficiency | 0.8 |
| Hours of operation per day | 4.25 hours |
| Number of days pool in use | 365 days per year |
| 1 HP Equals | 0.746 kW |

| | |
|----------------------------|---------------|
| Based Demand | 0.70 kW |
| Base Energy Usage per day | 2.97 kWh/day |
| Base Energy Usage per year | 1085 kWh/year |

| | |
|------------------------------|--------------|
| Demand Reduction | 10% |
| High Efficiency Demand | 0.63 kW |
| Energy Savings | 55% |
| High Efficiency Energy Usage | 488 kWh/year |

| | |
|--------------------|-----------|

| Coincidence Factor | 0.0862 kW |

| | |
|-------------------------|--------------|
| Energy Savings per year | 597 kWh/year |
| Peak Demand Reduction | 0.006 kW |

Lifetime of Efficient Equipment

The estimated useful life for a variable speed pool pump is 10 years.

Measure Cost

The incremental cost is estimated to be \$750 for a variable speed motor

Incentives

\$150

8.5 Energy Awareness, Measurement and Control Systems

8.5.1 Room Occupancy Sensors

Version Date & Revision History

Draft date: March 2, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

Flex your Power – “Occupancy sensors can reduce lighting costs by up to 50% in rooms where lights are frequently left on when no one is around.”

According to the Federal Energy Management Program (FEMP) of the US Department of Energy, in a small, private office, an occupancy sensor can reduce energy use by almost 30% shaving 100kWh off the annual energy use. In a large open office area, energy use can be reduced by approximately 10%.

TRM Review Actions:

- 10/5/11 – Currently Under Review.
- 11/14/13 – It is recommended that further research be conducted in order to determine if the savings assumptions used in this measure is appropriate.

Major Changes:

- n/a

Measure Description:

This measure is for wall switch sensors that controls the use of lighting in areas around the home with variable use such as laundry, storage, garage, bedrooms or spare areas.

Occupancy sensors must comply with:

- Energy Star
- UL Listing

Baseline Efficiencies:

The base case is an even split between two (2) 60W A-Shaped incandescent lamp and 15W Compact Fluorescent Lamp with the energy consumption as follows:

| Lamp Types | Demand Baseline (kW) | Hours per Day | Energy Baseline (kWh/year) | % | Totals |
|-----------------------------|----------------------|---------------|----------------------------|-----|----------|
| Incandescent | 0.060 | 2.30 | 50.4 | 50% | 25.2 kWh |
| CFL | 0.015 | 2.30 | 12.6 | 50% | 6.3 kWh |
| Watts per Lamp | | | | | 31.5 W |
| Lamps | | | | | 2 |
| Total Baseline Energy (kWh) | | | | | 63.0 kWh |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

High Efficiency:

The high efficiency case is 33% run time reduced.

| Lamp Types | Demand Baseline (kW) | Hours per Day | Energy Baseline (kWh/year) | % | Totals |
|------------------------------------|----------------------|---------------|----------------------------|-----|----------|
| Incandescent | 0.060 | 1.54 | 33.7 | 50% | 16.9 kWh |
| CFL | 0.015 | 1.54 | 8.4 | 50% | 4.2 kWh |
| Watts per Lamp | | | | | 21.1 W |
| Lamps | | | | | 2 |
| Total High Efficiency Energy (kWh) | | | | | 42.2 kWh |

Energy Savings:

Total Baseline Energy (kWh) 63.0 kWh
 Total High Efficiency Energy (kWh) 42.2 kWh
 20.8 kWh

Savings Algorithms

Room Occupancy Sensors - Single and Multi Family Residential Home

8.5.2 Peer Group Comparison

Version Date & Revision History

Draft date: September 18, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

TRM Review Actions:

- Continue to monitor participant vs control group energy usage comparison.
- 10/5/11 – Currently Under Review.

Major Changes:

- New PBFA 100% funded program.
- 11/22/11 – Removed detailed table from *Energy Savings* heading – not pertinent information.
- 11/14/13 – Change savings from 1.73% to 0.89%.

Measure Description:

The Behavior/Feedback programs send monthly energy use reports to participating electric customers in order to change customers' energy-use behavior. These reports rank the customers within a group of 100 similar sized homes in their neighborhood. Customers are also directed to a website with energy efficient tips and recommendations on energy conservation.

Energy Savings

The unit energy savings of 0.89% is based on EM&V recommendation.

Example Algorithm Calculating Customer Level Impact

$$\Delta \text{kWh} = (\text{Total Monthly Base Energy Usage})(\# \text{ of Participating Months})(\% \text{Savings})$$

Demand Savings

$$\Delta \text{kW} = \text{Annual } \Delta \text{kWh per Unit} / 3000 \text{ hours}$$

(Note: 3000 hours was based on 8.22 hours per day of active behavioral usage)

Where:

Unit = One participant household

%Savings = Energy savings percent per program participant

Baseline Efficiency

The baseline efficiency case is the control group that does not receive behavior and feedback program reports.

High Efficiency

The high efficiency case is test group receiving home energy reports.

Persistence

1 year

Measure Life

1 year

8.5.3 Whole House Energy Metering

Version Date & Revision History

Draft date: March 2, 2011
Effective date: July 1, 2013
End date: June 30, 2014

Referenced Documents:

- Hawaii Energy Historic Utility Billing Research – Residential Review 2010
- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- Changed energy savings from 2% to 3.8% based on EM&V Review.

Measure Description:

Whole house metering systems allow the occupant to see in real time the energy usage in their home. This “dashboard” allows them to see what actions and equipment drive their energy usage and the associated costs of running them. These devices collect energy data for the whole house at the panel and transmit the information to a display unit “dashboard” which can be located anywhere in the house.

Baseline Efficiencies:

| Building Types | Demand Baseline (kW) | Energy Baseline (kWh/year) |
|-----------------------|-----------------------------|-----------------------------------|
| No Metering | 1.50 | 12,000 |

High Efficiency:

| Building Types | Efficient Case (kW) | Efficient Case (kWh/year) |
|-----------------------|----------------------------|----------------------------------|
| Whole House Meter | 1.47 | 11,544 |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Energy Savings:

| Building Types | Efficient Case (kW) | Efficient Case (kWh/year) |
|-------------------|---------------------|---------------------------|
| Whole House Meter | 1.47 | 11,544 |

| Building Types | Gross Customer Savings (kW) | Gross Customer Savings (kWh/year) |
|------------------------|-----------------------------|-----------------------------------|
| Gross Customer Savings | 0.026 | 456 |

| Operational Factor | Adjustment Factor |
|--------------------------------|-------------------|
| Persistence Factor (pf) | 0.90 |
| Demand Coincidence Factor (cf) | 0.30 |

| Building Types | Net Customer Savings (kW) | Net Customer Savings (kWh/year) |
|----------------------|---------------------------|---------------------------------|
| Net Customer Savings | 0.007 | 410 |

Measure Description:

Custom Packaged Proposals will be on a case-by-case review for approval. Hawaii Energy will utilize existing TRM figures, new engineering calculations, modeling simulations as well as pre and post metering as appropriate to the measures proposed.

9.2 Residential Design

9.2.1 Efficiency Inside (New Home Construction Incentive)

Version Date & Revision History

Draft date: February 24, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- n/a

TRM Review Actions:

- 10/5/11 – Currently Under Review.
- 11/14/13 – Since this is a customized process, there are no technical assumptions to review.

Major Changes:

- n/a

Description: This measure provides developers with financial, technical and other assistance to promote the construction of homes that require the least amount of air conditioning to meet customer demands. It is assumed that all new homes will have Solar Water Heating, Energy Star Appliances, and CFLs. The components are:

- *Energy Model Review* – Used to compare the projected home performance as compared to an IECC 2006 built home. At least 6 scenarios must be modeled (IECC 2006, Proposed Home, Proposed with Cool Roof, Proposed with 4.0 ACH @ 50Pa, Proposed other energy feature, Proposed home with all modeled features).
- *Construction Quality Control (CQC)* – Mandatory inspections of a sampling of units during construction to insure best construction practices are used to maximize design and to encourage field improvements. (Sampled)
- *Performance Testing (PT)* – A sampling of units tested to document the final result of the design and building practices.
- *Whole House Metering System* – Permanent devices to support home owner energy awareness and persistence of savings.

Savings comes from:

- *Lower Cooling Loads:* Through design and construction techniques.
- *Right Sizing of AC Systems:* Selection of smaller ACs match energy models load determination.
- *Energy Use Awareness:* Home equipped with metering will have greater user awareness that will drive energy use behavior.

Energy and Demand Savings: It is expected that the best built homes systems will provide a 20-30% reduction in energy consumption as compared to IECC 2006 code built homes. Net zero homes will provide 100% reductions.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

- **Energy Modeling:** Energy savings will be determined through the cooling reductions modeled. This will be a combination of the construction and AC equipment selection.
- **Net Zero:** Net zero homes with PV are allowed and the predicted PV system output will be included in energy savings.

9.2.2 Solar Water Heating Tune-up

Version Date & Revision History

Draft date: February 21, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- KEMA "Impact Evaluation Report of the 2001-2003 Demand Side Management Programs" October 2004. Page 2-36 "Inoperable systems are those that use more than an average of 5 kWh per day, and problem systems use between 2-5 kWh per day."

TRM Review Actions:

-

Major Changes:

- New

Eligibility:

- Systems never received tune-up must be > 3 years old
- Systems that received a tune-up incentive cannot be eligible more than once every 5 years

Measure Description:

- Demonstrate the benefits of tune-ups
- Educate customer of potential savings and system longevity
- Utilize the participating contractors to contact the customers and have them arrange for the service work
- Participating contractors will use the Hawaii Energy Checklist to inspect and record the pre and post conditions
- Participating contractor's invoice must show that checklist requirements have been met and signed by the servicing technician

Baseline Efficiencies:

| | Energy (kWh) | Demand (kW) |
|----------|--------------|-------------|
| Baseline | 577 | 0.079 |

High Efficiency:

| | Energy (kWh) | Demand (kW) |
|-----------------|--------------|-------------|
| High Efficiency | 328 | 0.05 |

Energy/Demand Savings:

| | Energy (kWh) | Demand (kW) |
|----------------|--------------|-------------|
| Energy Savings | 249 | 0.029 |

TRM Review Actions:

- 10/06/11 – Added additional items to possible gift pack components list and corresponding data. Items included: LED lamp, low flow shower head for standard electric water heating systems, low flow shower head for solar heating systems, and faucet aerators.
- 10/06/11 – Currently Under Review.

Major Changes:

- 10/06/11 – Added additional items to possible gift pack components list (including data)
- 11/22/11 – LED algorithm updated. See section 8.2.2 for changes.
- 11/22/11 – Akamai Power Strip kWh savings updated based on NYSERDA Measure Characterization for Advanced Power Strips.
- 11/22/11 – Updated content in headings *Base Case*, *High Efficiency Case*, and *Energy Savings* in regard to LED lamps to match section 8.2.2.
- 11/29/11 – Low Flow Shower Head algorithms updated – previously claiming only 50% of total energy savings due to inaccurately calculating hot and cold water mix. Also updated *Energy Savings* table as necessary.
- 11/29/11 – Faucet Aerator algorithm updated – recalculated to follow low flow shower head algorithm, and include solar and non-solar calculations. Also updated *Energy Savings* table as necessary.
- 8/1/12 – Updated Low Flow Shower Head w/solar algorithm to reduce demand savings from 40% to 20% as per EM&V review (Feb. 2012)
- 8/1/12 – Updated Low Flow Shower Head algorithm to reduce demand savings from 40% to 20% as per EM&V review (Feb. 2012)
- 8/1/12 – Updated Faucet Aerator algorithm to using calculations method recommended by the EM&V review (Feb. 2012)
- 8/1/12 – Updated Faucet Aerator w/solar algorithm to align with Faucet Aerator w/o solar – based on the EM&V review (Feb. 2012)

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Description:

Potential gift pack components:

- Compact Fluorescent Lamp (15W)
- Akamai Power Strip
- LED Lamp (7W)
- Low Flow Shower Head – Solar Water Heater
- Low Flow Shower Head – Standard Electric Water Heater
- Faucet Aerator

Base Case

- 60 W incandescent lamps
- Standard power strip or no power strip
- 25% 60W incandescent, 25% 40W incandescent, 25% 23W CFLs and 25% 13W CFLs (See LED TRM)
- Shower Head – Solar Water Heater
- Shower Head – Standard Electric Water Heater
- Faucet Aerator

High Efficiency Case

- Replace 60 W incandescent lamps with CFLs rated at 15W
- Replace existing standard power strip or no power strip with Akamai Power Strip
- Replace existing non-LED lamp with LED lamp (50% 7W and 50% 12.5W)
- Replace Shower Head with Low Flow Shower (Solar) Head
- Replace Shower Head with Low Flow Shower (Electric) Head
- Replace with Low Flow Faucet Aerator

Energy Savings

| Measure | Energy Savings (kWh/yr) | Demand Savings (kW) |
|--------------------|-------------------------|---------------------|
| 15W CFL (3 Pack) | 108.9 | 0.015 |
| Akamai Power Strip | 78.0 | 0.0089 |
| 7W LED | 16.6 | 0.003 |

Note

No algorithms are shown for Low Flow Shower Heads or Faucet Aerators due to zero distribution of these measures for PY13.

10.1.2 CFL Exchange

Version Date & Revision History

Draft date: February 24, 2010
Effective date: July 1, 2013
End date: June 30, 2014

Referenced Documents:

- Energy and Peak Demand Impact Evaluation Report of the 2005-2007
- Demand Management Programs – KEMA (KEMA 2005-07)
- Econorthwest TRM Review – 6/23/10

TRM Review Actions:

- 6/23/10 Rec. # 8 – Starting with PY2010, adjust the hours used per day for CFLs from 4.98 to 2.3 in order to be consistent with other literature. Conduct additional research to verify the most appropriate hours of operation for the Hawaii customer base, which can be incorporated into future years. – Adopted.
- 6/23/10 Rec. # 9 - Starting with PY 2010, adjust the peak coincidence factor from 0.334 to 0.12 to be consistent with the literature. Conduct additional research to verify the most appropriate coincidence factor for the Hawaii customer base, which can be incorporated into future years.- Adopted.
- 10/5/11 – Currently Under Review.
- 11/14/13 – Changes will need to be made in PY14 to match the increases in federal minimum lighting standards over time.

Major Changes:

- Hours used per day for CFLs from 4.98 to 2.3 hrs.
- Peak coincidence factor from 0.334 to 0.12
- Updated persistence factor from 0.8 to 1.0. Lamps are replaced in a one-for-one fashion therefore all lamps will be used.

Measure Description:

The replacement of incandescent screw-in lamps to standard spiral compact fluorescent lamps in Residential Single Family and Multi-family homes.

Lamps must comply with:

- Energy Star
- UL

Baseline Efficiencies:

Baseline usage is a 60W A-Shaped incandescent lamp with the energy consumption as follows:

| Building Types | Demand Baseline(kW) | Energy Baseline (kWh) |
|----------------|---------------------|-----------------------|
| Single Family | 0.060 | 50.4 |
| Multi Family | 0.060 | 50.4 |

High Efficiency:

The high efficiency case is a 15W Spiral CFL with the energy consumption as follows:

| Building Types | Demand High Efficiency (kW) | Energy High Efficiency (kWh) |
|----------------|-----------------------------|------------------------------|
| Single Family | 0.015 | 12.6 |
| Multi Family | 0.015 | 12.6 |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Energy Savings:

CFL Gross Savings before operational adjustments:

| Building Types | Demand Savings (kW) | Energy Savings (kWh) |
|----------------|---------------------|----------------------|
| Single Family | 0.045 | 37.8 |
| Multi Family | 0.045 | 37.8 |

CFL Net Savings after operational adjustments:

| Operational Factor | Adjustment Factor |
|--------------------------------|-------------------|
| Persistence Factor (pf) | 1.0 |
| Demand Coincidence Factor (cf) | 0.12 |

| Building Types | Demand Savings (kW) | Energy Savings (kWh) |
|----------------|---------------------|----------------------|
| Single Family | 0.005 | 37.8 |
| Multi Family | 0.005 | 37.8 |

Savings Algorithms

Program Year 5 July 1, 2013 to June 30, 2014

10.1.3 Residential Water Cooler Timer

Measure ID:

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- LBNL 2007 - <http://enduse.lbl.gov/info/LBNL-56380%282007%29.pdf>
- EPA2012 - http://www.energystar.gov/index.cfm?fuseaction=find_a_product.showProductGroup&pgw_code=WA#specs

TRM Review Actions:

- Currently Under Review.

Major Changes:

- New measure

Measure Description:

Many homes have water coolers, often equipped with both cold and hot water spigots. Unbeknownst to many, however, is how much energy is used to continuously keep that water hot and cold.

Similar to the timers you might use to control lights in your home, water cooler timers are programmed to turn off during periods when family members are away or sleeping.

Baseline Efficiencies:

No timer

| Type of Water Cooler | Energy Usage | |
|----------------------|------------------------|-----------------------|
| | Cold Only (kWh/day) | Hot/Cold (kWh/day) |
| ENERGY STAR | 0.16 | 1.20 |
| Conventional | 0.29 | 2.19 |

Hours per Day 24

Days per year 365

| Base Case Usage | Cold Only | Hot/Cold |
|------------------------------|-----------|----------|
| ENERGY STAR USAGE (kWh/year) | 58 | 438 |
| Conventional (kWh/year) | 106 | 799 |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

High Efficiency:

Timer installed.

| Enhanced Case Usage | Cold Only | Hot + Cold |
|-------------------------|-----------|------------|
| ENERGY STAR (kWh/year) | 41 | 311 |
| Conventional (kWh/year) | 75 | 567 |

Energy Savings:

| Energy Savings | Cold Only | Hot + Cold |
|--------------------------------|-------------|------------|
| ENERGY STAR (kWh/year) | 17 | 127 |
| Conventional (kWh/year) | 31 | 233 |
| Average Savings (kWh/yr) | 24 | 180 |
| Ave Savings Combined (kWh/yr) | 102 | |
| Persistence Factor | 75% | |
| Energy Savings (kWh/yr) | 76.4 | |

Energy Savings Assumptions:

It is assumed that half of all water coolers are Energy Star and half are not:

- 50% Energy Star
- 50% Conventional

It is assumed that half of all water coolers are cold only and half are hot + cold dispenser:

- 50% Cold Only
- 50% Hot + Cold

The energy savings figure will be based on the average of the above-mentioned percentages.

Operating Hours: Timer Off from 10PM-5AM everyday.

Persistence Factor = 75% (half will not use for intended purpose)

Demand Savings:

No Demand savings since cooler is off from 10PM – 5AM.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

11 (BEEM) Business Energy Efficiency Measures

11.1 High Efficiency Lighting

11.1.1 Compact Fluorescent Lighting (CFL)

Version Date & Revision History

Draft date: February 24, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Econorthwest TRM Review – 6/23/10
- The California Energy Commission California Commercial End Use Summary
<http://www.energy.ca.gov/ceus/>
- DEER - The Database for Energy Efficient Resources
- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 6/23/10 Rec. 15 – For PY 2010, revise lighting hours of operation and peak coincidence factors, conduct additional research to evaluate the assumed hours of operation and coincidence factor for Hawaii customer base. - Adopted
- 6/23/10 Rec. # 16 – Consider developing commercial CFL measure categories by lamp size - Adopted.
- 10/5/11 – Currently Under Review.
- 8/1/12 – Added military housing CFL algorithm.

Major Changes:

- Wholesale replacement of prior TRM using DEER operational data and CEUS Commercial CFL Data
- Added interactive effect factors for energy and demand Table 3.

Description: A compact fluorescent lamp is a type of fluorescent lamp. Many CFL's are designed to replace an incandescent lamp and can fit in the existing light fixtures formerly used for incandescent lamps. CFLs typically replace 100 watts or less of incandescent.

CFL retrofit savings are determined by the delta wattage between the incandescent and CFL lamp, annual hours of operation, and the percent of peak period the lamps are on. The average delta wattage is typically a readily available value. The annual hours, persistence factor and peak percent are utilized based on DEER data.

Although the breakdown of lamp sizes installed is reasonable, the savings for this measure could be broken up based on lamp size. This would allow greater flexibility in matching claimed savings to actual projects completed. Savings for each wattage category are based on the savings for typical CFL lighting replacement projects from DEER, with the DEER wattage categories are shown below:

CFL Wattage Reduction

| | CFL Wattage Reduction | | |
|---------------------|-----------------------|--------|-------|
| | < 16W | 16-26W | > 26W |
| Average Savings (W) | 32 | 60 | 46 |

11.1.2 T12 to T8 with Electronic Ballast

Version Date & Revision History

Draft date: February 24, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Energy and Peak Demand Impact Evaluation Report of the 2005-2007
- Demand Management Programs – KEMA (KEMA 2005-07).
- Econorthwest TRM Review – 6/23/10
- DEER - The Database for Energy Efficient Resources
- The California Energy Commission California Commercial End Use Summary
<http://www.energy.ca.gov/ceus/>
- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 6/23/10 Rec. #18 – Break down T8 savings by lamp length – Adopted
- 10/5/11 – Currently Under Review.

Major Changes:

- Wholesale replacement of prior TRM using DEER operational data and CEUS Commercial Data
- Added interactive effect factors for energy and demand Table 3.

Description: This measure involves the replacement of an existing T12 lamp with a new high efficiency T8 lamp, and savings are calculated assuming standard T12 lamps and magnetic ballasts. The average watt savings per lamp for replacing 2', 3', 4', and 8' lamps is calculated by weighting the average toward those replacements that most likely to occur; largely 4' 2 lamp and 4' 4 lamp fixtures. Based on the assumed fixture distribution, the average savings per lamp is 18.6W.

Base Efficiency

The base case efficiency is either an existing T12 lamp with magnetic ballast.

High Efficiency

The high efficiency case is a T8 lamp with electronic ballast.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Demand Savings: Using the CEUS coincidence factors the demand savings are (see Table 3 for Interactive Effect):

| Building Type | Demand Savings (kW) | | |
|------------------|---------------------|---------|---------|
| | 2' Lamp | 3' Lamp | 8' Lamp |
| All Commercial | 0.0040 | 0.0070 | 0.0200 |
| Misc. Commercial | 0.0020 | 0.0040 | 0.0120 |
| Cold Storage | 0.0040 | 0.0070 | 0.0200 |
| Education | 0.0020 | 0.0030 | 0.0080 |
| Grocery | 0.0070 | 0.0110 | 0.0340 |

| Retail | 34.9 | 54.9 | 166.3 |
| Warehouse | 34.5 | 54.3 | 164.3 |

Incentive

| Equipment Description | All Commercial Demand (kW) Savings | All Commercial Energy Savings (kWh) | Current Incentive |
|-----------------------|------------------------------------|-------------------------------------|-------------------|
| 2'T12 - 2'T8 | 0.004 | 35.9 | \$4.80 |
| 3'T12 - 3'T8 | 0.007 | 56.4 | \$5.20 |
| 4'T12 - 4'T8 | 0.01 | 83.2 | \$5.60 |
| 8'T12 - 8'T8 | 0.02 | 170.8 | \$7.20 |

11.1.3 T8 to T8 Low Wattage

Version Date & Revision History

Draft date: February 24, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Energy and Peak Demand Impact Evaluation Report of the 2005-2007
- Demand Management Programs – (KEMA 2005-07).
- Econorthwest TRM Review – 6/23/10
- DEER-The Database for Energy Efficient Resources
- The California Energy Commission California Commercial End Use Summary
<http://www.energy.ca.gov/ceus/>
- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 6/23/10 Rec. #no number– Adjust with DEER/CEUS usage characteristics – Adopted
- 10/5/11 – Currently Under Review.
- 11/14/13 – Remove all forms of T12 lamps from the energy savings calculations in time for PY16.

Major Changes:

- Adjustment of hours and coincidence factors of prior TRM using DEER operational data and CEUS Commercial Data
- Added interactive effect factors for energy and demand Table 3.

Description:

This measure involves the replacement of 4' standard T8 with low wattage T8 fixtures and electronic ballasts.

Base Efficiency

The baseline T8 fixtures are assumed to be standard T8 (32W) lamps with standard magnetic ballasts.

High Efficiency

The high efficiency case is super T8 low wattage (25W/28W) lamps with high performance electronic ballasts.

Energy and Demand Savings:

The Base Watts and New Watts values are taken from Appendix B of the KEMA Report Table B-2. Appendix G of the KEMA report gives the same value for all Building Types. The following table shows the savings for low wattage T8 lamps and ballast compared to standard T8 lamps.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Energy and Demand Savings and Incentive Levels: Using the DEER operational hours (Energy) and the CEUS coincidence factors (Demand) the savings are the following (see Table 3 for Interactive Effect):

Commercial Lighting Factors

| Building Type | Hours of Operation ¹ | Peak Coincidence Factor ² | Demand (kW) Savings | Energy (kWh) Savings |
|------------------|---------------------------------|--------------------------------------|---------------------|----------------------|
| All Commercial | 4,325 | 0.50 | 0.009 | 38.9 |
| Misc. Commercial | 4,325 | 0.30 | 0.005 | 21.6 |
| Cold Storage | 4,160 | 0.50 | 0.009 | 37.4 |
| Education | 2,653 | 0.20 | 0.004 | 10.6 |
| Grocery | 5,824 | 0.85 | 0.015 | 87.4 |
| Health | 6,474 | 0.65 | 0.012 | 77.7 |
| Hotel/Motel | 4,941 | 0.60 | 0.011 | 54.4 |
| Misc. Industrial | 4,290 | 0.50 | 0.009 | 38.6 |
| Office | 2,808 | 0.50 | 0.009 | 25.3 |
| Restaurant | 5,278 | 0.75 | 0.014 | 73.9 |
| Retail | 4,210 | 0.60 | 0.011 | 46.3 |
| Warehouse | 4,160 | 0.45 | 0.008 | 33.3 |

² California Commercial End Use Summary (CEUS)

Incentive

| Equipment Description | All Commercial Demand (kW) Savings | All Commercial Energy Savings (kWh) | Current Incentive | ¢ /kWh |
|-----------------------|------------------------------------|-------------------------------------|-------------------|--------|
| 4'T12 - LW 4'T8 | 0.01 | 78.1 | \$10.00 | \$0.13 |
| 4'T8 - LW 4'T8 | 0.006 | 78.1 | \$5.50 | \$0.07 |

11.1.4 Delamping

Version Date & Revision History

Draft date: February 24, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Energy and Peak Demand Impact Evaluation Report of the 2005-2007
- Demand Management Programs – KEMA (KEMA 2005-07).
- Econorthwest TRM Review – 6/23/10
- DEER-The Database for Energy Efficient Resources
- The California Energy Commission California Commercial End Use Summary
<http://www.energy.ca.gov/ceus/>
- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 6/23/10 Rec. #20 – Break down the savings by lamp size. – Adopted
- 10/5/11 – Currently Under Review.

Major Changes:

- Adjustment of hours and coincidence factors of prior TRM using DEER operational data and CEUS Commercial Data
- Added interactive effect factors for energy and demand Table 3.

Description: The ballasts are re-wired for de-lamping.

Base Efficiency

The base case is no delamping

High Efficiency

The savings for this measure are determined by calculating the average watt reduction by removing either a 32 W T8, or a standard 40 W or reduced wattage 34 W T12 lamp from a standard ballast fixture, magnetic energy saving ballast fixture, or electric ballast fixture. This measure covers 2', 4' and 8' fixtures.

Incremental Cost

\$7.50 per lamp

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Energy and Demand Savings – see Table 3 for Interactive Effect.

| Delamping Avg. Wattage Reduction | | | | |

- DEER-The Database for Energy Efficient Resources
- The California Energy Commission California Commercial End Use Summary
<http://www.energy.ca.gov/ceus/>
- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 6/23/10 Rec. #20 – Break down the savings by lamp size. – Adopted
- 10/5/11 – Currently Under Review.

Major Changes:

- Adjustment of hours and coincidence factors of prior TRM using DEER operational data and CEUS Commercial Data
- Added interactive effect factors for energy and demand Table 3.

Description: Putting reflectors on the ballasts allows for more light, with less lamps. The ballasts are re-wired for de-lamping.

Base Case

The base efficiency case is no delamping with reflectors.

High Efficiency

The savings for this measure are determined by calculating the average watt reduction by removing either a 32 W T8, or a standard 40 W or reduced wattage 34 W T12 lamp from a standard ballast fixture, magnetic energy saving ballast fixture, or electric ballast fixture.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Energy and Demand Savings:

The wattage per lamp varies greatly depending on the size of the lamp. See Table 3 for Interactive Effect.

| Building Type | Demand Savings (kW) | | | |
|------------------|---------------------|---------|---------|---------|
| | 2' Lamp | 3' Lamp | 4' Lamp | 8' Lamp |

11.1.6 LED Refrigerated Case Lighting

Version Date & Revision History

Draft date: October 3, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- n/a

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- 8/13/12 – Measure updated as per EM&V report. The kWh calculations were updated to use new COP and hours per year numbers, and kW numbers were updated respectively.
- 11/14/13 – Correct the calculation of the refrigeration interactive effect to divide by the COP instead of multiply.

Measure Description:

This measure involves the replacement of a 40W T8 fluorescent lamp with a 23W LED linear lamp fixtures.

Baseline Efficiencies:

40W F40 T8 Linear Fluorescent Lamp

High Efficiency:

23W LED Linear Lamp

Energy Savings:

199.7 kWh

Demand Savings:

0.032 kW

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Savings Algorithms

LED Refrigerated Case Lighting Retrofit

Program Year 5 July 1, 2013 to June 30, 2014

11.1.7 LED

Version Date & Revision History

Draft date: November 30, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- The Database for Energy Efficient Resources (DEER)
- California Commercial End Use Summary (CEUS)
- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- 11/30/11 – Moved *LED Product Customized Process* measure to addendum (section 16.2.1) and created new prescriptive *LED* measure.
- Added interactive effect factors for energy and demand Table 3.

Measure Description: Light Emitting Diodes (LED) are a lighting technology that utilizes solid-state technology to produce light, opposed to fluorescent or incandescent lighting sources. In general, LED technology will provide energy levels 15% of a comparable incandescent lamp (15W to a 100W equivalent).

Baseline & High Efficiency:

25% Dimmable Demand Reduction

| Lamp | Base Case Incandescent Demand (kW) | Percent Incandescent Base | Base Case CFL Demand (kW) | Percent CFL Base | Base Mix Demand (kW) | Enhanced Case LED Demand (kW) | LED Demand Savings (kW) | Dimmable LED Demand Savings (kW) |
|------------------|------------------------------------|---------------------------|---------------------------|------------------|----------------------|-------------------------------|-------------------------|----------------------------------|

- 10/5/11 – Currently Under Review.

Major Changes:

- No changes

Measure Description:

Replacement of Incandescent Exit Signs with LED Exit Signs. Savings are equal across all building use types.

Baseline Efficiencies:

Demand Baseline has been determined by technical specifications of an incandescent exit sign, which typically holds two 20 W bulbs (40 W). The Energy Baseline is based on 24/7 operation of the sign (8,760 hours).

| Building Types | Demand Baseline(kW) | Energy Baseline (kWh) |
|----------------|---------------------|-----------------------|
| All Types | 0.040 | 351 |

High Efficiency:

The typical technical specification on an LED Exit Sign (through energystar.gov) claims “less than 5W” of Demand. The Energy High Efficiency figure is based on 24/7 operation (8,760 hours).

| Building Types | Demand High Efficiency (kW) | Energy High Efficiency (kWh) |
|----------------|-----------------------------|------------------------------|
| All Types | 0.005 | 44 |

Final Savings:

The Impact Evaluation Report by KEMA states that LED exit signs are expected to have high realization ratios and that measured savings were typically 100% of claimed savings. These figures match the suggested savings by the KEMA report.

| Building Types | Demand Savings (kW) | Energy Savings (kWh) |
|----------------|---------------------|----------------------|
| All Types | 0.035 | 307 |

11.1.10 HID Pulse Start Metal Halide

Version Date & Revision History

Draft date: February 24, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Energy and Peak Demand Impact Evaluation Report of the 2005-2007
- Demand Management Programs – KEMA (KEMA 2005-07).
- Econorthwest TRM Review – 6/23/10
- DEER-The Database for Energy Efficient Resources
- The California Energy Commission California Commercial End Use Summary
<http://www.energy.ca.gov/ceus/>
- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 6/23/10 Rec. #17 – Break down savings by wattage ranges pulse start metal halides- Adopted
- 10/5/11 – Currently Under Review.

Major Changes:

- Wholesale replacement of prior TRM using DEER operational data and CEUS Commercial Data
- Added interactive effect factors for energy and demand Table 3.
- Updated document regarding persistence and coincident factors based on EM&V review.

Referenced Documents:

Description: Traditional probe-start metal halide lamps do not use an igniter and require three electrical contacts to ignite the gas and remain lit. Recently developed pulse-start metal halide lamps use only two contacts and use an igniter located inside the ballast pod. Pulse-start lamps offer higher light output per unit of electric power. Multiple Wattages of Pulse-Start Metal Halides are installed. The most common have rated wattages between 100 and 250, with the majority of installations being 250 W.

Incremental Cost

\$150 (320W PS Replacing 400W HID)

Base Case

Probe start metal halide

High Efficiency

Lower wattage pulse start metal halide

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Energy Savings

The savings for pulse start metal halide fixtures are calculated based on a wattage savings for the replacement of a metal halide fixture with a smaller wattage pulse start metal halide fixture. Based on the wattages provided, it appears that it was assumed that a 175W metal halide fixture would be replaced with a 100W pulse start metal halide fixture, 250W metal halide fixture would be replaced with either a 150W or 175W pulse start metal halide fixture, and a 400W metal halide would be replaced with a 250W pulse start metal halide fixture. Based on the expected fixture wattages and breakdown of fixture installations, an average savings of 123W per fixture was assumed.

| Measure | Metal Halide (W) | Pulse Start Metal Halide (W) |
|------------------------|------------------|------------------------------|
| Equivalent Replacement | 175 | 100 |
| | 250 | 150 or 175 |
| | 400 | 250 |

Savings

| | Pulse Start Wattage Reduction | | |
|---------|-------------------------------|----------|----------|
| | <=100W | 101-200W | 201-350W |
| Average | 48 | 70 | 109 |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Energy Savings: Using the DEER operational hours the energy savings are (see Table 3 for Interactive Effect):

| Building Type | Pulse Start Energy Reduction | | |
|------------------|------------------------------|----------|----------|
| | <=100W | 101-200W | 201-350W |
| All Commercial | 209.0 | 302.0 | 471.4 |
| Misc. Commercial | 209.0 | 302.0 | 471.4 |

¹ The Database for Energy Efficient Resources (DEER)

² California Commercial End Use Summary (CEUS)

11.1.12 Sensors

Version Date & Revision History

Draft date: March 2, 2011
Effective date: July 1, 2013
End date: June 30, 2014

Referenced Documents:

Occupancy sensors can reduce lighting costs by up to 50% in rooms where lights are frequently left on when on one is around.”

According to the Federal Energy Management Program (FEMP) of the US Department of Energy, in a small, private office, an occupancy sensor can reduce energy use by almost 30% shaving 100kWh off the annual energy use. In a large open office area, energy use can be reduced by approximately 10%.

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- TRM measure previously discussed using smart-strips with occupancy sensors. Changed to occupancy sensors for lighting as intended in the annual plan. Updated energy conservations numbers accordingly.

Measure Description:

This measure is for wall switch sensors that controls the use of lighting in areas around the home with variable use such as laundry, storage, garage, bedrooms or spare areas.

Occupancy sensors must comply with:

- Energy Star
- UL Listing

Baseline Efficiencies:

The base case is two (2) 32W T8 fluorescent lamp.

High Efficiency:

The high efficiency case is 33% reduced run time from the base case.

Energy Savings:

Energy savings is calculated at 67.8 kWh per year per sensor.

11.1.13 Stairwell Bi-Level Dimming Lights

Version Date & Revision History

Draft date: March 30, 2014

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

Seattle City Light Energy Smart Services – ***“Funding Calculation Worksheets for Lighting”***

TRM Review Actions:

- Currently Under Review.

Major Changes:

- TRM measure previously discussed using smart-strips with occupancy sensors. Changed to occupancy sensors for lighting as intended in the annual plan. Updated energy conservations numbers accordingly.

Measure Description:

Stairwell lighting typically operates continuously at full output despite very low, intermittent use. Bi-level stairwell dimming lights utilizes either an ultra-sonic or infrared motion sensor to detect motion in stairwells. Solid state controls are used to dim fixtures to lower light levels when a space is unoccupied. This technology is ideal for areas where codes user preferences, safety, or security requirements call for minimal light levels during unoccupied periods and full light output during occupied periods. Fixtures must be UL compliant. If the enhanced case is LED, it must meet program requirements which is 3 year warranty, one of the following: Energy Star/DLC/LED Lighting Facts, UL compliant.

Baseline Efficiencies:

The base case is no bi-level dimming lights with occupancy sensors.

High Efficiency:

The high efficiency case is bi-level dimming lights with occupancy sensors.

Energy Savings:

Energy savings is calculated based on the modified customized lighting worksheet which accounts for the following:

- Watts (Base)
- Watts (Enhanced)
- Hours of operation (including peak period of 5PM-9PM)
- % on High/Low Level (based on the following table from Seattle City Light Energy Smart Services):

Seattle City Light Energy Smart Services Funding Calculation Worksheets for Lighting

- Occupancy Reference Table 1. Occupancy Type Codes -

Use this table to find the Occupancy Type Code inputs

Measure Life: 14 years (DEER)

11.2 High Efficiency HVAC

11.2.1 Chiller

Version Date & Revision History

Draft date: February 24, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Econorthwest TRM Review – 6/23/10
- IECC 2006

TRM Review Actions:

- 6/23/10 Rec. #23 – Utilize IECC 2006 Efficiencies as the Baseline Efficiency and Efficient Packaged Unit 15% better than IECC 2006 – Adopted
- 6/23/10 Rec. #24 - break down the savings by chiller type and size. Conduct additional research for future program years to calibrate claimed savings for Hawaii customer base.- Adopted

Major Changes:

- Chiller efficiency selected at 15% improvement over IECC 2006.

Description: The replacement of chillers with Energy Efficiency above the code efficiency values in place at the time of permitting the project. In multiple unit chiller plants, a review of operational chillers will be conducted to determine what fraction of installed chillers will be incentivized. This is to avoid paying for standby units.

High Efficiency Chiller - 15% higher than IECC 2006

| | | IECC 2006 IPLV (kW/Ton) | Hawaii Energy Premium Efficiency (kW/Ton) |
|----------------------------|--------------|----------------------------|---|

Measure Life

20 years (DEER)

Incentive

\$0.15/kWh

11.2.2 VFD – Chilled Water/Condenser Water

Version Date & Revision History

Draft date: February 24, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Energy and Peak Demand Impact Evaluation Report of the 2005-2007
- Demand Management Programs – KEMA (KEMA 2005-07).
- Econorthwest TRM Review – 6/23/10
- IECC 2006

TRM Review Actions:

- 6/23/10 Rec. #25 - Breakdown the savings by building types. Conduct additional research for future program years to calibrate claimed savings for Hawaii customer base – Adopted
- 10/5/11 – Currently Under Review.

Major Changes:

- Energy savings separated into building type breakdown.

Description: The installation of variable frequency drives on chilled and/or condenser water pumps used in HVAC systems.

Qualification

- Require pre-notification before projects begin.
- The program reserves the right to perform on-site verifications, both pre- and post-installation.
- Existing equipment must not have a VFD. (i.e. – incentives are not available for replacement)
- For existing facilities, motor hp must be between 3 and 100.
- For new facilities, motor hp must be between 3 and 50.
- The VFDs must actively control and vary the pump speed.

Energy and Demand Savings

Energy Savings = 902.7 kWh per HP

Demand Savings = 0.245 kW per HP

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

HVAC Pump Motor VFD

DSMIS Values for All Commercial

kW = 0.245 per HP

kWh = 902.7 per HP

KEMA 2008 Values for All Commercial (HECO):

kW = none available

kWh = none available

Base Pump Motor Use:

| | | |
|-----------------------|-------|-------------------|
| Base HP = | 10 HP | Example |
| Motor Efficiency = | 92% | Estimated Typical |
| Average Load = | 75% | Estimated Typical |
| HP to kW conversion = | 0.746 | |

kW load = $HP \times 0.746 \times \% \text{ Load/eff}$ = 6.1 kW

Hours of operation = 6000 hours Estimated

kWh Used Annually = kW load * Hours = 36,489

Pump Motor Savings with VFD:

Energy Savings percentage = 24.74% Needed to meet the kWh savings from DSMIS

kWh savings = % savings * kWh annual use = 9,027 kWh

kW average savings = kWh savings/Hours = 1.50 kW

kW savings = average kW savings * CF = 2.45 kW Based on DSMIS value of 245 watts per HP

CF needed = kW savings (program) / kW average = 1.63

Incentive
\$80/HP

11.2.3 VFD – AHU

Version Date & Revision History

Draft date: February 24, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Energy and Peak Demand Impact Evaluation Report of the 2005-2007
- Demand Management Programs – KEMA (KEMA 2005-07).
- Econorthwest TRM Review – 6/23/10
- IECC 2006
- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 6/23/10 Rec. #25 - Breakdown the savings by building types. Conduct additional research for future program years to calibrate claimed savings for Hawaii customer base – Adopted
- 10/5/11 – Currently Under Review.

Major Changes:

- Energy savings separated into building type breakdown.
- Updated energy and demand savings based on EM&V review.

Description: The installation of variable frequency drives on fans used in HVAC systems.

Values for this measure are not called out in the KEMA report. The DSMIS values for this measure are 200 watts and 760.9 kWh per horsepower. The primary assumption used for the savings calculation is that the percentage savings of the energy used before the VFD is applied. This percent savings is shown in the calculations below as about 21%. Based on information from the EPRI Adjustable Speed Drive directory and comparing energy use for outlet damper, inlet damper and VFD controls the average savings for this profile would be 50% for replacement of an outlet damper and 33% for replacement of an inlet damper. See table below.

| Percentage of Full Load Power | | | | Power Savings % | |
|-------------------------------|----------------|---------------|-----|-----------------|---------------|
| % Flow | Outlet Dampers | Inlet Dampers | VFD | Outlet Savings | Inlet Savings |
| 100 | 111 | 109 | 105 | 6 | 4 |
| 90 | 107 | 93 | 73 | 34 | 20 |
| 80 | 104 | 82 | 57 | 47 | 25 |
| 70 | 99 | 75 | 44 | 55 | 31 |
| 60 | 94 | 69 | 32 | 62 | 37 |
| 50 | 87 | 65 | 21 | 66 | 44 |
| 40 | 80 | 63 | 14 | 66 | 49 |
| 30 | 72 | 60 | 8 | 64 | 52 |
| Average | | | | 50 | 33 |

Therefore, the 21% of base case savings used in to match the DSMIS values in the calculations below appears to be reasonable and possibly conservative. The actually savings for the customer will depend on many factors related to their type of building, system and hours of operation.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

VFD AHU – Energy and Demand Savings:

| Building Type | Hours | Demand Savings (kW/HP) | Energy Savings (kWh/HP) |
|------------------|-------|------------------------|-------------------------|
| All Commercial | 3,720 | 0.20 | 471.69 |
| Misc. Commercial | 3,720 | 0.20 | 471.69 |
| Cold Storage | 6,389 | 0.20 | 810.12 |
| Education | 3,665 | 0.20 | 464.72 |
| Grocery | 6,389 | 0.20 | 810.12 |
| Health | 5,187 | 0.20 | 657.71 |
| Hotel/Motel | 3,719 | 0.20 | 471.57 |
| Misc. Industrial | 5,187 | 0.20 | 657.71 |
| Office | 6,192 | 0.20 | 785.14 |
| Restaurant | 4,155 | 0.20 | 526.85 |
| Retail | 3,261 | 0.20 | 413.49 |
| Warehouse | 6,389 | 0.20 | 810.12 |

Example Calculation:

HVAC Fan Motor VFD

DSMIS Values for All Commercial

kW = 0.200 per HP

kWh = 760.9 per HP

KEMA 2008 Values for All Commercial (HECO):

kW = none available

kWh = none available

Base Pump Motor Use:

| | | |
|-----------------------|-------|-------------------|
| Base HP = | 10 HP | Example |
| Motor Efficiency = | 92% | Estimated Typical |
| Average Load = | 75% | Estimated Typical |
| HP to kW conversion = | 0.746 | |

kW load = $HP \times 0.746 \times \% \text{ Load/eff} =$ 6.1 kW

Hours of operation = 3,720 hours Estimated

kWh Used Annually = kW load * Hours = 22,623 22623.26

Pump Motor Savings with VFD:

Energy Savings percentage = 20.85% Needed to meet the kWh savings from DSMIS

kWh savings = % savings * kWh annual use = 4,717 kWh

kW average savings = kWh savings/Hours = 1.268 kW

kW savings = average kW savings * CF = 2.0 kW Based on DSMIS value of 200 watts per HP

CF needed = kW savings (program) / kW average = 1.58

11.2.4 Garage Demand Ventilation Control

Version Date & Revision History

Draft date: October 3, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- ASHRAE Standard 62
- International Mechanical Code
- Department of Health (DOH) Title 11 Chapter 39 (Air Conditioning and Ventilation)

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- New program offering.
- 11/22/11 – Under *Description*, the phrase “City Codes” was changed to “Codes” for accuracy.

Description:

Demand-controlled ventilation (DCV) using carbon monoxide (CO) sensing is a combination of two technologies: Sensors that monitor CO levels in the parking garage, and an air-handling system that uses data from the sensors to regulate the amount of ventilation air admitted. CO sensors continually monitor the air in a parking garage. Given a predictable activity level, automobiles will exhaust CO at a predictable level. Thus CO production in the parking garage will closely track activity. Given these two characteristics, a CO measurement can be used to measure and control the amount of outside air that is being introduced to dilute the CO generated by automobiles. The result is that ventilation rates can be measured and controlled to a specific cfm/ft². This is in contrast to the traditional method of ventilating at a fixed rate regardless of occupancy.

City codes for enclosed parking areas require ventilation during all hours of operation to protect against an unhealthful build-up of carbon monoxide (CO). As a result, exhaust fans generally run 100% of operating hours. Although some buildings use timers to cut fan run time, it is important to note that the use of timers may not meet code compliance and health considerations. To achieve major energy savings and meet all health requirements, carbon monoxide sensors have now been authorized by code and mandated in some jurisdictions for new construction. Sensors measure CO levels, activating fans only when necessary to maintain CO at an acceptable level, saving upwards to 90% of energy cost.

Program Requirements:

1. Pre-notification before equipment is purchased and installed.
2. New construction is not eligible.
3. Incentive amount not to exceed Installed Cost.
4. Failure of devices causes the exhaust fans to operate in the ON position

Energy and Demand Savings:

All assumptions, data and formulas used in the calculations must be clearly documented. Standard engineering principles must be applied, and all references cited. Pre and post monitoring will be conducted to determine measured energy and demand savings.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Savings Algorithms

Gross energy and demand savings estimates for custom projects are calculated using engineering analysis and project-specific details including pre and post monitoring. A physical fan motor audit will be performed as well as spot amperage checks and logging of pre and post operational times.

Baseline Efficiency

The baseline efficiency case assumes compliance with the efficiency requirements as mandated by the Hawaii State Energy Code or industry accepted standard practice.

High Efficiency

The high efficiency case is the installation of a parking garage ventilation demand control device utilizing carbon monoxide sensors.

Persistence Factor

PF = 1 since all custom projects require verification of equipment installation.

Incentives

- \$0.12/kWh
- Incentives is limited to 100% of incremental costs.
- Installations are subject to inspection for up to 5 years. Removal will be cause for incentive forfeiture.

Measure Life

8 years

Hawaii Energy - Technical Reference Manual No. 2013

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

11.2.5 Package Unit AC

Version Date & Revision History

Draft date: February 24, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Econorthwest TRM Review – 6/23/10
- Econorthwest Email Correspondence – 1/23/12
- IECC 2006, pg. 34

TRM Review Actions:

- 6/23/10 Rec. #21 – Utilize IECC 2006 Efficiencies as the Baseline Efficiency and Efficient Packaged Unit 15% better than IECC 2006 – Adopted
- 6/23/10 Rec. #22 - Break down packaged AC savings based on equipment size. – Adopted
- 10/5/11 – Currently Under Review.

Major Changes:

- Package chiller unit AC efficiency selected at 15% improvement over IECC 2006.
- 12/12/11 – kW/ton and EER values updated to match IECC 2006 package unit values as per Econorthwest's direction, high efficiency numbers adjusted accordingly. Energy & demand savings updated accordingly.

Description: The replacement of package and split unit air conditioners with Energy Efficiency above the Hawaii Model Energy Code.

Package Units

| Unit Size (Btu/Hr.) | IECC 2006 Efficiency | | Hawaii Energy Premium Efficiency | |
|------------------------|-------------------------|----------|--|-----------|
| | (kW/ton) | SEER/EER | (kW/ton) | SEER/EER |
| < 65,000 | 1.364 | 9.7 SEER | 1.159 | 11.2 SEER |
| 65,000 to 134,999 | 1.165 | 10.3 EER | 0.990 | 11.8 EER |
| 135,000 to 239,999 | 1.237 | 9.7 EER | 1.052 | 11.2 EER |
| 240,000 to 759,999 | 1.263 | 9.5 EER | 1.074 | 10.9 EER |
| > 760,000 | 1.304 | 9.2 EER | 1.109 | 10.6 EER |

11.2.6 Inverter Variable Refrigerant Flow (VRF) Split Air Conditioning Systems

Version Date & Revision History

Draft date: February 24, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- Original TRM values was divided by .8 but have been corrected to be multiplied by 1.2 in order to obtain a 20% increase in efficiency.

Description: Inverter driven variable refrigerant flow (VRF) air conditioning systems are direct expansion AC systems that utilize variable speed evaporator/condenser fans, and a combination of fixed and variable speed compressors along with most often multiple individual zone evaporators to provide the ability to more closely match the AC system's output with the building's cooling requirements. Savings comes from:

- *Part Load Efficiencies:* Increased part-load efficiency operation
- *High Efficiency Motors:* Many systems use ECM motors
- *Higher Room Temperatures:* The capacity matching allows for better humidity control through longer cooling operation.
- *Reduction of Distribution Losses:* Duct losses are reduced with DX systems. This may be offset by dedicated outside air distribution systems when needed.

Payback Qualifications: VRF products need a payback requirement of 1 year or greater. The TRB/TRC must be greater than 1.

Energy and Demand Savings: VRF systems have demonstrated a 20-30% reduction in energy consumption as compared to standard DX equipment. The energy savings and demand tables that follow provide the savings by building type and system size for VRF systems. These figures are conservatively determined to be 20% greater than provided by the "Standard" Package Unit AC measures that require EERs 15% greater than IECC 2006 requirements.

The VRF applications have been new construction projects with no ability to perform pre and post measurements. Hawaii Energy will perform field pre and post field measurements to determine the measure effectiveness in the local environment

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

11.3 High Efficiency Water Heating

11.3.1 Commercial Solar Water Heating

Version Date & Revision History

Draft date: May 30, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- n/a

TRM Review Actions:

- 10/5/11 – Currently Under Review.
- 11/14/13 – more research should be done to determine typical baseline efficiencies for both standard electric resistance and heat pump water heaters.

Major Changes:

- n/a

Measure Description:

Replacement of a Standard Electric Resistance Water Heater (SERWH) or heat pump with a Solar Water Heater. Solar equipment must comply with Solar Rating and Certification Corporation (SRCC) standards.

Baseline Efficiencies:

Baseline usage is a 0.9 COP Electric Resistance Water Heater or heat pump with a COP of 3.5.

The baseline water heater energy consumption is by a single 4.0 kW electric resistance element that is controlled thermostatically on/off controller based of tank finish temperature set point. The tank standby loss differences between baseline and high efficiency case are assumed to be negligible.

The baseline water heater energy consumption by a heat pump is 6.0 kW.

Energy Savings

| Base Case | Annual Energy Savings (kWh/year) (per 5,000 BTU capacity derated) | Demand Savings (kW) |
|---|--|---------------------|
| Standard Electric Resistance Water Heater (COP = 0.9) | 429 | 0.46 |
| Heat Pump (COP 3.5) | 32 | 0.75 |

Measure Life

15 years

11.3.2 Heat Pump

Version Date & Revision History

Draft date: February 24, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Evergreen TRM Review – 2/23/12

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- Adjust the assumptions so the description and calculations are consistent.

Measure Description

This measure relates to the installation of a heat pump water heater (HPWH) in place of a standard electric water heater. HPWHs can be added to existing domestic hot water (DHW) systems to improve the overall efficiency. HPWHs utilize refrigerants (like an air source heat pump) and have much higher coefficients of performance (COP) than standard electric water heaters. HPWHs remove waste heat from surrounding air sources and preheat the DHW supply system. HPWHs come in a variety of sizes and the size of HPWH will depend on the desired temperature output and amount of hot water needed by application. The savings from water heater heat pumps will depend on the design, size (capacity), water heating requirements, building application and climate. This measure could relate to either a retrofit or a new installation.

Definition of Efficient Equipment

In order for this characterization to apply, the efficient equipment is assumed to be a heat pump water heater with or without an auxiliary water heating system.

Definition of Baseline Equipment

In order for this characterization to apply, the baseline equipment is assumed to be a standard electric storage tank type water heater with a thermal efficiency of 98%. This measure does not apply to natural gas-fired water heaters.

Deemed Lifetime of Efficient Equipment

The expected measure life is assumed to be 10 years

Deemed Measure Cost

Due to the complexity of heat pump water heater systems, incremental capital costs should be determined on a case by- case basis. High capacity heat pump water heaters will typically have a supplemental heating source such as an electric resistance heater. For new construction applications, the incremental capital cost for this measure should be calculated as the difference in installed cost of the entire heat pump water heater system including any auxiliary heating systems and a standard electric storage tank water heater of comparable capacity. For retrofit applications, the total installed cost of heat pump water heater should be used.

11.4 High Efficiency Water Pumping

11.4.1 Domestic Water Booster Packages

Version Date & Revision History

Draft date: May 23, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- The increased incentive was based on previous paid booster pump installations and measured energy/demand savings. Previous Incentive Level = \$0.06/kWh. New Incentive Levels = \$0.08/kWh
- The energy and demand impacts are based on HECO's evaluation from past projects and monitoring.

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- Effective 7/1/10 through 3/6/11
VFD Installation: \$1,600
HP Reduction: \$65 x Number of reduced HP
- Effective 3/7/11 through 6/30/14
VFD Installation: \$3,000
HP Reduction: \$80 x Number of reduced HP
- Updated the TRM algorithm. Clarified energy savings to calculate per HP.

Description:

The purpose of this measure is to reduce energy consumption through more efficient domestic water booster systems by installing a VFD and/or reducing pump HP. Pump improvements can be done to optimize the design and control of water pumping systems. The measurement of energy and demand savings for commercial and industrial applications will vary with the type of pumping technology, operating hours, efficiency and current and proposed controls. Depending on the specific application, slowing the pump, trimming or replacing the impeller, or replacing the pump may be suitable options for improving pumping efficiency.

Base Efficiency

The baseline equipment is assumed to be a non-optimized existing pumping system.

High Efficiency

In order for this characterization to apply, the efficient equipment is assumed to be an optimized pumping system meeting applicable program efficiency requirements. The proposed Booster Pump System must be a more efficient design than the existing system. (i.e. Installed with VFD.). All pump motors must meet NEMA Premium Efficiency standards.

Qualification

- Booster Pump applications require pre-notification before equipment is purchased and installed.
- The new Booster Pump System's total horsepower must be equal to or less than that of the existing system.
- The system horsepower reduction must be between 0 to 129 hp. For projects with greater than 129hp, please contact the program
- Booster Pump applications do not apply to New Construction.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Energy and Demand Savings:

| Source of Savings (per HP) | Yearly kWh Reduction | kW Reduction |
|----------------------------|----------------------|--------------|
| Reduced HP | 3921 | 0.373 |
| Installation of VFD | 588 | 0.056 |

Savings Algorithm:

Domestic Water Booster Packages

REDUCED HP

| | |
|---------------------------------------|------------------------------------|
| Motor Energy Consumption | 0.746 kW / hp |
| Run Time | x 8760 hrs / year |
| Percent Run Time | x 60% percent run / day |
| Yearly Savings per HP Reduction | 3921 Total kWh savings / hp / year |
| 3921 kWh Reduction / HP / Year | |

| | |
|-------------------------------------|---|
| Demand Savings per HP | 0.746 kW savings per hp |
| Coincidence Factor | x 50% peak coincidence factor |
| Peak Demand Savings | 0.373 kW savings per hp during peak hour (5 p.m. to 9 p.m.) |
| 0.373 Peak kW Reduction / HP | |

INSTALLATION OF VFD

| | |
|---|-----------------------------------|
| Motor Energy Consumption | 0.746 kW / hp |
| Percent Load Reduction with VFD | x 15% percent load reduction |
| Demand Savings per HP | 0.112 kW savings per hp |
| Run Time | x 8760 hrs / year |
| Energy Savings per hp with VFD | 980.24 kWh savings / hp / year |
| Percent Run Time | x 60% pump percent run time |
| Total Energy Savings per hp with VFD | 588 Total kWh savings / hp / year |
| 588.15 kWh Reduction / HP / Year | |

EM&V review comments recommend 500 - 700 kWh savings (Feb. 23, 2012)

| | |
|-------------------------------------|---|
| Demand Savings per HP | 0.112 kW savings per hp |
| Coincidence Factor | x 50% peak coincidence factor |
| Peak Demand Savings | 0.056 kW savings per hp during peak hour (5 p.m. to 9 p.m.) |
| 0.056 Peak kW Reduction / HP | |

Incentives:

VFD Installation: \$3,000

HP Reduction: \$80 x Number of reduced HP

11.4.2 VFD Pool Pump Packages

Version Date & Revision History

Draft date: February 24, 2010
Effective date: July 1, 2013
End date: June 30, 2014

Referenced Documents:

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- 12/15/11 – Updated algorithm average pump size from 1.5 HP pump to 1 HP pump. Updated baseline and high efficiency calculations accordingly.

Measure Description

A variable speed commercial pool pump motor in place of a standard single speed motor of equivalent horsepower.

Definition of Efficient Equipment

The high efficiency equipment is a variable speed commercial pool pump.

Definition of Baseline Equipment

The baseline efficiency equipment is assumed to be a single speed commercial pool pump.

$$\Delta \text{kWh} = (\text{kWBASE} \times \text{Hours}) \times 55\%$$

Where:

| | |
|---------------------|--|
| Unit | = 2-speed or variable speed pool pump |
| ΔkWh | = Average annual kWh reduction |
| Hours | = Average annual operating hours of pump |
| kWBASE | = connected kW of baseline pump |
| 55% | = average percent energy reduction from switch to 2-speed or variable speed pump (1) |

Baseline Efficiency

The baseline efficiency case is a single speed pump.

High Efficiency

The high efficiency case is a 2-speed or variable speed pump.

Energy and Demand Savings

| | |
|-----------------|------------------------|
| Demand Savings: | 0.093 kW / HP |
| Energy Savings: | 1123 kWh per year / HP |

|--------------------------------|-----------------------------|

Deemed Lifetime of Efficient Equipment

The estimated useful life for a variable speed pool pump is 10 years.

Deemed Measure Cost

The incremental cost is estimated to be \$350 for a two speed motor and \$1,500 for a variable speed motor

Incremental Cost

\$161 per motor. – (from: 2001 DEER Update Study, CCIG-CRE-02, p. 4-84, Xenergy, Oakland, CA.

Incentives

\$225/HP

11.5 High Efficiency Motors

11.5.1 CEE Tier 1 Listed Premium Efficiency Motors

Version Date & Revision History

Draft date: March 2, 2011
Effective date: July 1, 2013
End date: June 30, 2014

Referenced Documents:

- n/a

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- 11/22/11 – Removed the following sentence from *Measure Description*: “Therefore, this measure should be suspended at that time.”

Measure Description

This measure relates to the installation of premium efficiency three phase Open Drip Proof (ODP) and Totally Enclosed Fan-Cooled (TEFC) motors less than or equal to 200 HP, meeting minimum qualifying efficiency for the following HVAC applications: supply fans, return fans, exhaust fans, chilled water pumps, and boiler feed water pumps. On December 9, 2010, new federal efficiency standards will take effect requiring motors in this size category to meet National Electric Manufacturers Association (NEMA) premium efficiency levels.

- Incentives apply to both ODP and TEFC enclosures with 1200 RPM, 1800 RPM or
- 3600 RPM motors.
- Motors must meet minimum efficiency requirements as shown in the Motor Incentive Reference Table on the CEE Premium Efficient Motors list available at www.cee1.org.
- Motors greater than 200 hp will be given consideration under the Hawaii Energy Customized Program
- If motors are not listed on the CEE website, submit manufacturer specifications, motor curve and performance data to Hawaii Energy for consideration

Baseline

2007 EISA nominal efficiency (as defined in NEMA MG1 Table 12-12) motors.

High Efficient Condition

The CEE Motors List includes motors that are 1-200 hp NEMA Design A/B, 460 volts, TEFC or ODP and 1200rpm, 1800 rpm, or 3600 rpm.

15 years

Incremental Cost

1 to 5HP (\$35.20 per HP)

7.5 to 20HP (\$17.30 per HP)

25 to 100HP (\$10.28 per HP)

125 to 250HP (\$5.95 per HP)

11.5.2 Refrigeration – ECM Evaporator Fan Motors for Walk-in Coolers and Freezers

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- 2007 Arkansas Deemed Savings Quick Start Programs
http://www.aepeer.com/oklahoma/ci/downloads/Deemed_Savings_Report.pdf

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- n/a

Measure Description:

An electronically commutated motor (ECM) is a fractional horsepower direct current (DC) motor used most often in commercial refrigeration applications such as display cases, walk-in coolers/freezers, refrigerated vending machines, and bottle coolers. ECMs generally replace shaded pole (SP) motors and offer at least 50% energy savings. Analysis efforts summarized in this report focused on the most prevalent use of ECMs – refrigeration, where motor sizes are typically listed in watts (10-140 W).

Measure/Technology Review

Five of the primary data sources reviewed for this effort contained data for ECMs in refrigeration and HVAC applications. The NPCC study gave savings estimates for upgrading a CAV box single speed motor to an ECM. The other four studies gave wide ranging savings and cost data for compressor, condenser, and evaporator fan motors. KW Engineering completed a study for PacifiCorp in October of 2005 regarding the market for ECMs in walk-in refrigerators (KW Engineering, 2005). This study included the market share in each state for refrigeration ECMs as well as cost and energy savings data. These values for energy and demand savings are given in Table 1 below.

| Measure Information Available | Resource | Application | Annual Energy Savings ¹ (kWh/unit) | Demand Savings ¹ (kW/unit) |
|-------------------------------|------------------------|-------------------------------|---|---------------------------------------|
| Yes | Ecotope 2003 | Small Evaporator Fan ECM | 200 | - |
| Yes | PG&E 2003 | Evaporator Fan | 673 | 0.077 |
| Yes | Stellar Processes 2006 | Small Evaporator Fan ECM | 200 | - |
| No | Xcel Energy 2006 | | | |
| No | Quantec 2005 | | | |
| No | DEER | | | |
| No | KEMA 2006 | | | |
| Yes | CEE | Evaporator Fan – Freezer | 115 | 0.013 |
| | | Condenser Fan – Freezer | 141 | 0.016 |
| | | Compressor Fan – Freezer | 985 | 0.112 |
| | | Evaporator Fan – Refrigerator | 294 | 0.034 |
| | | Condenser Fan – Refrigerator | 141 | 0.016 |
| | | Compressor Fan - Freezer | 690 | 0.079 |
| No | Energy Star | | | |
| No | RTF | | | |
| Yes | NPCC 2005 | CAV Box | 517 | 0.397 |
| Yes | kW Engineering 2005 | Evaporator Fan | 734 | 0.084 |

¹ Savings values reflect gross savings at the customer meter

Table 1

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Baseline Efficiencies:

The standard motor type for this application is a shaded pole (SP) motor. Table 2 contains the baseline annual energy consumption and demand for ECM equivalent SP motors.

Table 2 (Baseline Efficiency)

| Measure | Annual Energy Consumption | Demand |
|------------------------|---------------------------|------------|
| Shaded Pole (SP) motor | 18 kWh/W | 0.002 kW/W |

Minimum Requirements/High Efficiency

Any ECM up to 1 hp in size will meet the minimum requirements for both retrofit and new construction installations. Table 3 contains the estimated annual energy consumption, demand, and cost for the ECM application.

Table 3 (High Efficiency)

| Measure | Annual Energy Consumption | Demand |
|---------|---------------------------|------------|
| ECM | 8.7 kWh/W | 0.001 kW/W |

Energy Savings:

| Annual Energy Savings | Demand Savings |
|-----------------------|----------------|
| 9.3 kWh/W | 0.001 kW/W |

Savings Algorithms

Deemed demand and energy savings should be calculated by the following formulas for Refrigeration applications:

$$\text{kW savings} = \text{Rated Wattage} \times (\text{kW/W}_{\text{pre}} - \text{kW/W}_{\text{post}})$$

$$\text{kWh savings} = \text{Rated Wattage} \times (\text{kWh/W}_{\text{pre}} - \text{kWh/W}_{\text{post}})$$

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Where:

Rated Wattage = Rated Wattage of the electronically commutated motor

kW /W pre = Demand of the existing electronically commutated motor. If unavailable, demand listed in Table 2 should be used

kW /W post = Demand of the new electronically commutated motor. If unavailable, demand listed in Table 3 should be used

kWh /W pre = Annual energy consumption of the existing electronically commutated motor. If unavailable, annual energy consumption listed in Table 2 should be used

kWh /W post = Annual energy consumption of the new electronically commutated motor. If unavailable, annual energy consumption listed in Table 3 should be used

Lifetime

DEER – 15 years

Measure Costs and Incentive Levels

\$85 per motor and controller set

11.5.3 EC Motors – Fan Coil Units

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- n/a

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- n/a

Measure Description:

Electronically commutated motors provide clear advantages over AC or conventional DC motors in terms of service life, controllability, flexibility, and cost-effectiveness.

For the past 30 years, forward-bladed centrifugal fans in fan coil-units have been driven by AC motors, which are typically around 45% efficient. However, the latest electronically commutated (EC) motors are 80% efficient, leading to significant operational benefits. The term EC is applied to a DC motor having electronic commutation achieved with a microprocessor.

Commutation means applying a current to the motor phases to produce the best torque at the motor's shaft. In brush-type motors, commutation is done electromechanically using graphite brushes and a commutator. In brushless motors, however, it is achieved by switching electronics using rotor-position information obtained by sensors. Thus, the EC motor is essentially a DC motor that can be connected direct to an AC mains supply.

Baseline Efficiencies:

| BASE CASE | | |
|-------------------------------|-----|-------|
| Base demand 4 pole (1800 rpm) | 107 | watts |

High Efficiency:

ENHANCED CASE

| | | |
|------------------------------|----|-------|
| High efficiency DC/EC demand | 54 | watts |
|------------------------------|----|-------|

The major advantage of EC motors over their AC counterparts is far higher efficiency, which enables a fan-coil unit to achieve a specific fan power (SFP) of 0.3 compared with 0.8 for an AC motor (the limit in the latest Building Regulations is 0.8 W/l/s).

This higher efficiency can be maintained at low speeds, so less motor heat is absorbed by the cold air discharged from the FCU, which in turn leads to more cooling applied in the space. Lower temperatures increase motor life, and in-built soft starting gives longer bearing life.

Speed control is simple, and results in impressive energy saving performance. The maximum cooling load on an FCU may only apply for 500 hour out of a total annual running time of 3,000 hour. With a typical fan coil unit, the fans deliver more air than necessary for 2500 hour/year — a shocking waste of energy.

By using the temperature controller on an FCU to reduce the speed of the EC motor during periods of reduced cooling demand, we can cut energy wastage dramatically. For example, an annual fan energy consumption of 620 kWh can be reduced to 140 kWh using speed control.

The reduction of air volume is, however, limited by considerations of the room air distribution. That is why we recommend that tests are undertaken in a suitable test facility to determine the optimum range of air volume.

Energy Savings:

ENERGY SAVINGS

| | | |
|-----------------------|-----|----------|
| Energy savings 4 pole | 232 | kWh/year |
|-----------------------|-----|----------|

PEAK DEMAND SAVINGS (5PM-9PM)

| | |
|--------------------|-----|
| Coincidence factor | 0.5 |
|--------------------|-----|

| | | |
|------------------------------|--------|----|
| Peak demand savings (4 pole) | 0.0265 | kW |
|------------------------------|--------|----|

Electronically commutated motors offer six major benefits when used in fan-coil units.

- High efficiency of 85%, leading to lower input power.
- Lower rise in air temperature on the air stream.
- Efficient speed control.
- Longer motor life resulting from lower running temperatures.
- Longer bearing life because of the soft-start feature.
- Suitable for a 230 V supply.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

By considering a typical 2 fan, fan coil unit providing 190l/s of air against an external resistance of 30Pa, from the testing undertaken by Caice the following figures were derived:

- 4 pole AC Motor Fan Unit powered by 2 off fans energy consumed = 107 watts, sfp 0.55 = w/l/s
- DC/EC Motor Fan Unit powered by 2 off fans energy consumed = 54 watts, sfp = 0.28 w/l/s.

Savings Algorithms

11.6.1 Demand Control Kitchen Ventilation (DCKV)

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Detailed Energy Savings Report, Melink Corporation,
http://www.melinkcorp.com/Intellihood/Energy_Analysis.pdf

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- n/a

Measure Description:

Kitchen ventilation with DCKV hood exhaust. Demand ventilation uses temperature and/or smoke sensing to adjust ventilation rates. This saves energy comparing with the traditional 100% on/off kitchen ventilation system.

Baseline Efficiencies:

Kitchen ventilation without DCKV. Usage per HP:

$$\text{Basecase} = (\text{HP} \times .746 \text{ kW/HP} \times \text{Hours per Year}) / \text{efficiency}$$

| | |
|--|------|
| Basecase fan motor usage per HP (kWh/year) | 4827 |
| Basecase fan motor demand (kW) | 0.83 |

High Efficiency:

Usage per HP:

| | |
|---|------|
| Enhanced case fan motor usage per HP (kWh/year) | 2194 |
| Enhanced case fan motor demand (kW) | 0.38 |

Energy Savings:

The demand control kitchen ventilation savings were determined using the method described in the Melink Detailed Energy Savings Report.

| | |
|---|------|
| Energy Savings from fan motor per HP (kWh/year) | 2633 |
| Demand Savings from fan motor per HP (kW) | 0.45 |

TBD

Persistence

TBD

Lifetime

15 Years (Hawaii Energy assumption)

Measure Costs and Incentive Levels

Measure Cost: \$1,200 - \$1,700 per HP based on business vertical and site complications (provided my Melink)

Incentive Levels: \$700/installed HP (for both existing and new construction whether 1 sensor or 2).
Sensors can be either temperature or smoke/fume.

11.6.2 Refrigeration – Cooler Night Covers

Measure ID:

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- CL&P Program Savings Documentation for 2011 Program Year (2010). Factors based on Southern California Edison (1997). Effects of the Low Emissive Shields on Performance and Power Use of a Refrigerated Display Case.
- Energy & Resource Solutions (2005). Measure Life Study. Prepared for the Massachusetts Joint Utilities; Page 4-5 to 4-6.

Major Changes:

- New measure

Measure Description:

Installation of retractable aluminum woven fabric covers for open-type refrigerated display cases, where the covers are deployed during the facility unoccupied hours in order to reduce refrigeration energy consumption.

Baseline Efficiencies:

The baseline efficiency case is the annual operation of open-display cooler cases.

High Efficiency:

The high efficiency case is the use of night covers to protect the exposed area of display cooler cases during unoccupied hours.

Energy Savings:

$$\Delta \text{kWh} = (\text{Width})(\text{Save})(\text{Hours})$$

$$\Delta \text{kW} = (\text{Width})(\text{Save})$$

Where:

Width = Width of the opening that the night covers protect (ft)

Save = Savings factor based on the temperature of the case (kW/ft) – see table below

Hours = Annual hours that the night covers are in use.

| Cooler Case Temperature | Savings Factor |
|----------------------------------|----------------|
| Low Temperature (-35 to -5 F) | 0.03 kW/ft |
| Medium Temperature (0 F to 30 F) | 0.02 kW/ft |
| High Temperature (35 F to 55 F) | 0.01 kW/ft |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Operating Hours

Hours represent the number of annual hours that the night covers are in use, and should be determined on a case-by-case basis.

Demand Coincidence Factor

Coincidence factors are set to zero since demand savings typically occur during off-peak hours

Lifetime

10 years

Eligibility

- Must install a cover on an existing open refrigerated display case to decrease its cooling load during off hours.
- The equipment manufacturer must not object to the use of night covers for the existing display case model.
- This incentive is based on linear footage of the installed night cover.
- The cover must be applied for a period of at least six hours.

Measure Costs and Incentive Levels

Incentive = \$10/linear foot

| *Cost | Linear feet | Material (\$/linear feet) | Labor (\$/linear feet) | Total (\$/linear feet) |
|--------|-------------|------------------------------|---------------------------|---------------------------|
| \$ 235 | 4 | \$ 58.75 | \$ 15.00 | \$ 73.75 |

11.7 Building Envelope Improvements

11.7.1 Window Tinting

Version Date & Revision History

Draft date: March 2, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Basis for a Prescriptive Window Film Rebate Program (Attachment G) prepared for HECO (XENERGY Inc.) November 5, 1999

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- Rebate increased from \$0.35 to \$1.00 per square foot
- Changed from 0.4 shading coefficient (SC) to 0.5 SC

Description:

- *Warranty* – Film must have a minimum five-year manufacturer's warranty and one-year installer's warranty
- *Conditioned Space* – Rebates shall be paid on actual square footage of glass in a conditioned space
- *Eligible Types* – Windows may be clear or factory tinted, single or double pane, but must not have reflected glass. All orientations are eligible.
- *Unshaded* – Windows significantly shaded by buildings, trees or awnings are not eligible for rebates.
- *Replacement Film* – Replacement of deteriorated window film is eligible for 50% of the rebate if the customer did not receive a rebate for the existing film.

Equipment Qualifications:

- Shading Coefficient < 0.5
- Solar Heat Gain Coefficient (SHGC) < 0.435
- $SC = 0.87 \times SHGC$
- Replacement of deteriorated window film is eligible for 50% of the incentive if the customer did not receive an incentive from the existing window film. The incentive will be rounded up.

Payback Qualifications:

None

Energy and Demand Savings:

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- n/a

Description

This section covers installation of "cool roof" roofing materials in commercial buildings. The cool roof is assumed to have a solar absorptance of 0.3(1) compared to a standard roof with solar absorptance of 0.8(2). Energy and demand saving are realized through reductions in the building cooling loads. The approach utilizes DOE-2.2 simulations on a series of commercial prototypical building models. Energy and demand impacts are normalized per thousand square feet of roof space.

Definition of Efficient Equipment

The efficient condition is a roof with a solar absorptance of 0.30.

Definition of Baseline Equipment

The baseline condition is a roof with a solar absorptance of 0.80

Deemed Lifetime of Efficient Equipment

The expected lifetime of the measure is 15 years (3)

Deemed Measure Cost

The full installed cost for retrofit applications is \$8,454.67 per one thousand square feet (4).

Deemed O&M Cost Adjustments

There are no expected O&M cost adjustments for this measure.

Coincidence Factor

The coincidence factor is 0.74(5).

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Energy Savings

$$\Delta \text{kWh} = \text{SF} / 1000 * \Delta \text{kWhkSF}$$

$$\Delta \text{kWh} = 0.25 \text{ kWh / square feet}$$

Coincident Peak Demand Savings

$$\Delta \text{kW} = \Delta \text{kW} \times \text{CF}$$

Where:

$$\text{CF} = \text{The coincident peak factor} = 0.50$$

Demand Savings per square feet

$$\Delta \text{kW} = 0.0001 * 0.50$$

$$\Delta \text{kW} = 0.00005 \text{ kW}$$

Baseline Adjustment

There are no expected future code changes to affect this measure.

Deemed O&M Cost Adjustment Calculation

There are no expected O&M costs or savings associated with this measure.

Unit energy, demand, and gas savings data is based on a series of prototypical small commercial building simulation runs.

Incentive

\$0.20/Square Foot (Roof Surface Area w/conditioned space below).

11.8 Energy Star Business Equipment

11.8.1 Refrigerators w/Recycling

Version Date & Revision History

Draft date: February 24, 2010

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- HECO DSM Docket – Backup Worksheets - Global Energy (07-14-06)
- Econorthwest TRM Review – 6/23/10
- Department of Energy Refrigerator Profile – Updated December 2009

TRM Review Actions:

- 6/23/10 Rec. # 11 – Revise savings to be consistent with ENERGY STAR estimates. – Adopted with modifications on refrigerator figures based on DOE Refrigerator profile and the addition of bounty, recycle with new figures.
- 6/23/10 Rec. # 12 – Split the claimed savings by appliance. – Adopted.
- 6/23/10 Rec. # 14 – Revise demand savings values for ENERGY STAR appliances – Adopted.
- 10/5/11 – Currently Under Review.

Major Changes:

- Split between ESH appliances
- Incorporation of three refrigerator categories (new, new with turn in, and bounty (turn in only))
- All ESH 313 kWh and 0.12 kW changed to:
 - New ES Refrigerator Only – 105 kWh, .017 kW
 - New ES Refrigerator with Turn-In – 822 kWh, .034 kW

Measure Description:

The replacement of standard Refrigerators for business locations.

Appliances must comply with:

- Energy Star

Refrigerators – ENERGY STAR refrigerators utilize improvements in insulation and compressors.

Baseline Efficiencies:

Baseline energy usage based on 2009 Energy Star Information for the appliances are as follows:

| | Demand Baseline (kW) | Energy Baseline (kWh) | Notes |
|--------------------------------|-------------------------------------|----------------------------------|-----------------------|
| Non ES Qualifying Refrigerator | | 537 | 19.0-21.4 Top Freezer |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

High Efficiency:

The high efficiency case Energy Star energy usage based on 2009 Energy Star Calculator Information and DOE Refrigerator Market Profile for the appliances is as follows:

| | Demand High Efficiency (kW) | Energy High Efficiency (kWh) | Notes |
|----------------------------|-----------------------------------|------------------------------------|-----------------------|
| ES Qualifying Refrigerator | | 435 | 19.0-21.4 Top Freezer |

Energy Savings:

Energy Star Appliance Gross Savings before operational adjustments:

| | Demand Savings (kW) | Energy Savings (kWh) |
|------------------------------|---------------------------|----------------------------|
| ES Refrigerator | 0.017 | 105 |
| ES Refrigerator with Turn-In | 0.034 | 822 |

Energy Star Appliance Net Savings operational adjustments:

| Operational Factor | Adjustment Factor |
|--------------------------------|-------------------|
| Persistence Factor (pf) | 1.0 |
| Demand Coincidence Factor (cf) | 1.0 |

Savings Algorithms

11.9 Energy Awareness, Measurement and Control Systems

11.9.1 Condominium Submetering

Version Date & Revision History

Draft date: March 2, 2011

Effective date: July 1, 2012

End date: June 30, 2013

Referenced Documents:

- n/a

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- n/a

Description:

Equipment Qualifications:

This program is to assist master-metered condominiums and their Association of Apartment Owners (AOAO) efforts to reduce energy consumption and implement the current submetering proposal as one that will insure both equity and fairness in allocating energy costs as well as encouraging energy conservation through direct feedback of personal energy use to tenants.

The combination of billing submeters, along with education, peer group comparisons and special equipment offerings, will assist the tenant achieve significant energy conservation and efficiency.

Requirements:

- The metering system must remain in place and billing to occur for a period of at least five (5) years or a pro-rated portion of the incentive will be recovered by Hawaii Energy. Provide Hawaii Energy with energy meter data for analysis purposes.
- A joint educational and monitoring program will be undertaken with AOAO to assist in the verification of savings and development of an ongoing energy incentive offering for other condominiums in Hawaii.

Baseline

The base case is no submetering. Baseline Annual Energy Usage is the actual average usage (kWh/year) based on historical usage for past 24 months (or as appropriate) for entire condominium (master metered) divided by the number of condominium units. Baseline demand (kW) is the Average Historical Demand divided by the number of condominium units.

| Building Types | Demand Baseline (kW) | Energy Baseline (kWh/year) |
|-----------------------|-----------------------------|-----------------------------------|
| Condominium | 1.42 | 7,200 |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

High Efficiency

The high efficiency case is with submetering. It is expected there will be a 10% reduction in energy usage and 8% reduction in peak demand during (5PM – 9PM).

| Building Types | Efficient Case (kW) | Efficient Case (kWh/year) |
|----------------|---------------------|---------------------------|
| Condominium | 1.30 | 6,480 |

Energy and Demand Savings:

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Incentives/Incremental Cost

- \$150 per unit metered, payable to the AOA for distribution to owners on a percentage of ownership basis to comply with condominium regulations.
- Incentive payment will be made upon billing individual tenants.
- Incentive payment cannot exceed 50% of total project cost.
- The payment of the incentive will be based on the AOA securing the approval, installing and utilizing the submeters for billing purposes.
- There is no minimum reduction in electrical use to be required by AOA to retain the incentive.

| Description | Incentive | Incremental Cost |
|----------------------|-----------|------------------|
| Condominium Submeter | \$150 | \$750 |

Measure Life: 8 years (based on DEER. Similar technology as time-clocks and occupancy sensors)

11.9.2 Small Business Submetering Pilot

Version Date & Revision History

Draft date: October 3, 2011

Effective date: July 1, 2011

End date: June 30, 2012

Referenced Documents:

- n/a

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- n/a

Description:

Equipment Qualifications:

This program is to assist master-metered small businesses to reduce energy consumption that will insure both equity and fairness in allocating energy costs as well as encouraging energy conservation through direct feedback of personal energy use to business tenants.

The combination of billing submeters, along with education, peer group comparisons and special equipment offerings, will assist the tenant achieve significant energy conservation and efficiency.

Requirements:

- The metering system must remain in place and billing to occur for a period of at least five (5) years or a pro-rated portion of the incentive will be recovered by Hawaii Energy. Provide Hawaii Energy with energy meter data for analysis purposes.
- A joint educational and monitoring program will be undertaken with the businesses to assist in the verification of savings and development of an ongoing energy incentive offering for other condominiums in Hawaii.

Baseline

The base case is no submetering

| Building Types | Demand Baseline (kW) | Energy Baseline (kWh/year) |
|-----------------------|-----------------------------|-----------------------------------|
| Small Business | 3.00 | 10,800 |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

High Efficiency

The high efficiency case is with submetering

| Building Types | Efficient Case (kW) | Efficient Case (kWh/year) |
|----------------|---------------------|---------------------------|
| Small Business | 2.76 | 9,720 |

Energy and Demand Savings:

| Building Types | Gross Customer Savings (kW) | Gross Customer Savings (kWh/year) |
|----------------|-----------------------------|-----------------------------------|
| Small Business | 0.24 | 1,080 |

| Operational Factor | Adjustment Factor |
|--------------------------------|-------------------|
| Persistence Factor (pf) | 1.00 |
| Demand Coincidence Factor (cf) | 1.00 |

| Building Types | Net Customer Savings (kW) | Net Customer Savings (kWh/year) |
|----------------|---------------------------|---------------------------------|
| Small Business | 0.24 | 1,080 |

It is expected there will be at least 10% reduction in energy usage and 8% reduction in peak demand during (5PM – 9PM), however, there is no minimum reduction in electrical use to be required to retain the incentive.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Incentives/Incremental Cost

- Incentive payment will be made upon billing individual tenants.
- Incentive payment cannot exceed 50% of total project cost.

Incentive = \$150 per tenant unit

12 (CBEEM) Custom Business Energy Efficiency Measures

12.1 Customized Project Measures

12.1.1 Customized Project Measures

Version Date & Revision History

Draft date: March 2, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- n/a

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- Incentive values have decreased from PY12

Description: The Custom project measure is offered for energy efficiency projects involving complex site-specific applications that require detailed engineering analysis and/or projects which do not qualify for incentives under any of the prescriptive rebate offering. Projects offered through the custom approach must pass a cost-effectiveness test based on project-specific costs and savings.

| Measure Life | Reduction in Energy Use Incentive | Evening Peak Demand Reduction (5:00 p.m. to 9:00 p.m. weekdays) | Day Peak Demand Reduction (12:00 p.m. to 2:00 p.m. weekdays) | First Year Energy Savings (kWh) | Demand Savings (kW) |
|--------------|-----------------------------------|--|---|---------------------------------|---------------------|
| < 5 years | \$0.08 /kWh | \$125 / kW | *\$100 / kW | | |
| > 5 years | \$0.12 /kWh | \$125 /kW | *\$100 /kW | | |

Program Requirements:

- Approval is required prior to the start of work on any customized project.
- Total resource benefit ratio is greater than or equal to 1.
- Incremental simple payback greater than one year or six months for LED projects.

Requirements for Non ENERGY STAR[®] LED Lamps

- Five year manufacturer warranty or three year manufacturer warranty with LM79 and LM80 (1,000 hour) tests
- UL Listed

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Energy and Demand Savings:

All assumptions, data and formulas used in the calculations must be clearly documented. Standard engineering principles must be applied, and all references cited. Energy saving calculations shall also reflect the interactive effects of other simultaneous technologies to prevent the overstatement of the actual savings. Proposed base and enhanced cases must be performed by a qualified person or firm. In some cases, a professional engineer may be required to provide verification of the analysis.

Savings Algorithms

Gross energy and demand savings estimates for custom projects are calculated using engineering analysis and project-specific details. Custom analyses typically include a weather dependent load bin analysis, whole building energy model simulation, or other engineering analysis and include estimates of savings, costs, and an evaluation of the project's cost-effectiveness.

Baseline Efficiency

The baseline efficiency case assumes compliance with the efficiency requirements as mandated by the Hawaii State Energy Code or industry accepted standard practice.

High Efficiency

The high efficiency scenario is specific to the custom project and may include one or more energy efficiency measures. Energy and demand savings calculations are based on projected changes in equipment efficiencies and operating characteristics and are determined on a case-by-case basis. The project must be proven cost-effective and pass total resource benefit and have a payback greater than or equal to 1.

Persistence Factor

PF = 1 since all custom projects require verification of equipment installation.

Incentives

- Incentives is limited to 50% of incremental costs.
- Installations are subject to inspection for up to 5 years. Removal will be cause for incentive forfeiture.

13 (BESM) Business Energy Services and Maintenance

13.1 Business Direct Installation

13.1.1 Small Business Direct Lighting Retrofits

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- n/a

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- n/a

Measure Description:

The program targets customers within the small business market. Typically this market has limited time and expertise within their organizations to research lighting technology options, obtain financing and contract with lighting contractors to replace their older less efficient lighting technologies. The Small Business Lighting Retrofit provides a “Turnkey” program consisting of audits, fixed pricing, installation by participating Hawaii Energy contractors and 4 month financing of lighting retrofits.

Program Requirements:

Small Business Customers receiving eclectic power under a Schedule “G” rate, or are similar to Schedule “G” but are under master-metered accounts, are eligible under this program.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

13.2 Business Design, Audits and Commissioning

13.2.1 Benchmark Metering

Version Date & Revision History

Draft date: March 2, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- n/a

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- n/a

Description:

This program is designed to improve building operations through a systematic approach of installing critical metering, performing retro-commissioning activities to identify and optimize system operations, and then measuring and sharing results.

Claimed Savings

Energy and Demand savings (100%) will be claimed upfront and 50% payment of claimed energy savings will be paid at \$0.10/kWh upon implementation (1 month after start of Operational Period).

Adjustment of Incentive Funding

- **Return of Incentive Funds for Decreased Energy Savings**
If overfunded, customer shall return the difference between the actual and estimated claimed energy saving to the Program.
- **Additional Funding for Increased Energy Savings**
If underfunded, payment will be made to customer (up to 100% of investment).

Process

A baseline energy usage will be determined based on both metering and engineering calculations. Post meter installation review along with spot measurements will be conducted.

Initial Meeting

Application

Preliminary Systems Review

- Consultant Price Proposal
- Consultant Perform Systems Review
 - Consultant Provide Metering and Commissioning Plan

Metering and Commissioning Plan

- Approve Metering Plan
- Approve Metering Budget
- Metering Installation
- Design/Oversight/Test Metering/Base Meter Readings – 2 weeks

System Commissioning Plan

- Approve Commissioning Plan
- Investigation
- Analysis/Documentation
- Field Commissioning/Tuning
- Development of Sequence of Operations
- Recommend Operational Improvements
- Recommended System Upgrades
- Maintenance and Operations Plan
- Operational Training
- System Commissioning Budget

Final Metering and Commissioning Report & Documentation Submittal

Operational Performance Period

- Start Operation Period (after commissioning, training)
 - Estimated Performance Assessment 1 – (1 month after start of Operational Period)
 - Estimated Performance Assessment 2 – (6 month after start of Operational Period)
 - Estimated Performance Assessment 3 – (End of Operational Period)
- End Operational Period (1 – year after start of operational period)
- Review Savings Achievement

164

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Incentives and Responsibilities:

| Incentive | Amount | Responsibilities |
|------------------------|--|---|
| Commissioning Contract | 50% incentive up to \$0.20 per sq. ft. | <ul style="list-style-type: none"> • Preliminary Systems Review • Metering Plan • Development of Sequence of Operations • Operational Improvements • System Upgrade Improvements • Maintenance and Operations Plan • Operational Training • Owner commitment to participate in the Optimization Competition |
| Metering System | 100% incentive for approved metering equipment and data collection systems | <ul style="list-style-type: none"> • Access to performance data for five years. • Owner commitment to perform operational and system upgrade recommendations with less than 2 year paybacks up to the cost of the metering incentive within two years or forfeit metering incentive |
| Energy Reduction | \$0.10 per kWh saved for one year | <ul style="list-style-type: none"> • 50% upon implementation • 25% for performance at sixth month • 25% for performance at one year |

*Total incentives not to exceed customer cost.

13.2.3 Decision Maker – Real Time Submetering - Advanced Pump Efficiency Program (APEP)

Version Date & Revision History

Draft date: April 8, 2013

Effective date: May 1, 2013

End date: June 30, 2014

Referenced Documents:

- n/a

TRM Review Actions:

- n/a

Major Changes:

- New measure/program offering

Measure Description:

This program is an educational and incentive program intended to encourage energy efficiency and conservation for water supply entities by providing metering (flow & power) devices to measure, test and improve pumping efficiency. The purpose is to determine if their pumps are performing at optimal capacity and to make cost-effective recommendations for needed repairs and/or adjustments.

Baseline Efficiencies:

The baseline case is the existing pump as found with no change in operation or retrofit.

High Efficiency:

The high efficiency case is making efficiency adjustments/improvements to the pump after conducting a pump test which measures the pump's operation including flow, pressure and power usage.

Energy Savings:

Savings will be determined on a case-by-case basis based on actual energy and demand savings through pre and post measurements.

Overall pump efficiency (OPE) can be generally characterized as follows:

| Motor HP | Low% | Fair % | Good % | Excellent | | |
|----------|--------|-------------|-------------|-----------|---------|-------------|
| | | | | Well Pump | Booster | Submersible |
| 3 - 5 | ≤ 41.9 | 42.0 - 49.9 | 50.0 - 54.9 | ≥ 55.0 | ≥ 55.0 | ≥ 52.0 |
| 7.5 - 10 | ≤ 44.9 | 45.0 - 52.9 | 53.0 - 57.9 | ≥ 58.0 | ≥ 60.0 | ≥ 55.0 |
| 15 - 30 | ≤ 47.9 | 48.0 - 55.9 | 56.0 - 60.9 | ≥ 61.0 | ≥ 65.0 | ≥ 58.0 |
| 40 - 60 | ≤ 52.9 | 53.0 - 59.9 | 60.0 - 64.9 | ≥ 65.0 | ≥ 70.0 | ≥ 62.0 |
| 75 - up | ≤ 55.9 | 56.0 - 62.9 | 63.0 - 68.9 | ≥ 69.0 | ≥ 72.0 | ≥ 66.0 |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Algorithm

Water Pumping

Base Pump Motor Use:

| | | |
|---|------------|-----------|
| Base HP = | 10 HP | Example |
| Motor Efficiency = | 92% | Example |
| Average Load = | 75% | Example |
| HP to kW conversion = | 0.746 | |
| | | |
| kW load = $HP * 0.746 * \% \text{ Load} / \text{eff}$ = | 6.1 kW | |
| | | |
| Hours of operation = | 6000 hours | Estimated |
| | | |
| kWh Used Annually = kW load * Hours = | 36,489 | |

Pump Motor Savings with VFD:

| | |
|--|-----------|
| Energy Savings percentage = | 24.74% |
| | |
| kWh savings = $\% \text{ savings} * \text{kWh annual use}$ = | 9,027 kWh |
| | |
| kW average savings = $\text{kWh savings} / \text{Hours}$ = | 1.50 kW |
| | |
| Coincidence Factor (CF) | 0.5 |
| | |
| kW savings = $\text{average kW savings} * \text{CF}$ = | 0.75 kW |

| | |
|-----------------------------|------------|
| Energy Savings (kWh/HP) | 903 kWh/HP |
| Peak Demand Savings (kW/HP) | 0.08 kW/HP |

Operating Hours

TBD

Demand Coincidence Factor

TBD

Persistence

TBD

Lifetime

1 year – TBD

Measure Costs and Incentive Levels

The following incentive budget will be allocated to the following counties:

- \$50,000 – Honolulu
- \$50,000 – Maui
- \$50,000 – Hawaii

13.2.4 Energy Study

Version Date & Revision History

Draft date: September 20, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- n/a

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- n/a

Description: The Energy Study is an indirect impact product that offers Hawaii businesses with analysis services to identify energy saving opportunities. The goal of the energy study is to provide a method for commercial and industrial customers to learn how their business uses energy today and to identify measures that will help them save energy and reduce operating costs in the future. The focus is on a customer's core energy efficiency opportunities.

Program Requirements:

- Program approval is required prior to the start of work on the energy study
- The program reserves the right to review all materials that result from a program-supported study including, but not limited to, final reports, consultant recommendations, and metered data
- The study must be performed by a qualified person or firm. A brief summary of the consultant's qualifications should be submitted with the application. In some cases, a professional engineer may be required to provide verification of the analysis
- At any time, customers may contact program staff to discuss a project, get assistance in preparing an application, or with any program-related questions

Energy and Demand Savings:

All assumptions, data and formulas used in energy efficiency calculations must be clearly documented. Standard engineering principles must be applied, and all references cited. Energy saving calculations shall also reflect the interactive effects of other simultaneous technologies to prevent the overstatement of the actual savings.

Savings Algorithms

Gross energy and demand savings estimates for energy studies are calculated using engineering analysis and project-specific details. Energy study analyses typically include estimates of savings, costs, and an evaluation of the cost-effectiveness of potential projects/upgrades.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Energy Study

The Energy Study shall include the following information and be presented in the following format:

- 1) Executive Summary
 - a) Energy Conservation Measures (ECMs) Proposed
 - b) Summary of Baseline and Enhanced Case Assumptions
 - c) Actionable Recommendations in "loading order."
- 2) Technical Information and Analysis
 - a) Energy Consumption Analysis
 - i) Two years of billing data (weatherized and compared to some pertinent operating metric)
 - b) Description of the project
 - c) Proposed Energy Conservation Measures (ECM)
 - i) Descriptive Name
 - ii) Schematic System Drawing
 - iii) Current Peak Demand (kW), Energy Usage (kWh), Effective Full Load Run Hours
 - iv) Proposed Peak Demand (kW), Energy Usage (kWh), Effective Full Load Run Hours
 - v) % Change for above
 - vi) Estimated Installation Cost
 - vii) Project timeline
 - viii) Measure Life
 - ix) Simple Payback
 - d) Base case information
 - i) Short term/spot baseline thermal, fluid, and electrical measurements for major equipment to be changed with ECMs
 - ii) Permanent metering data (This metering will qualify for additional cost assistance)
 - iii) Sizing/Performance Reviews (Pump Curves, Cooling Bin Data etc.)
 - e) Enhanced case information
 - i) How will performance be measured in the future.
 - ii) Description of where energy savings occurs (lower run time, more efficient operations etc.)
 - f) Estimated energy and demand savings associated with your proposed project
 - i) Applicable figures and tables
 - ii) Simple payback period and/or life cycle costs
 - g) Estimated costs including design, materials, and installation
- 3) Appendix
 - a) Raw and Analyzed Data (Cooling Models, Field Data, Pictures, Metering Data etc.)
 - b) Building Plans (Mechanical, Electrical Schedules, Layouts etc.)

Incentives

- Incentives are limited to 50% of the cost of the study up to \$15,000

13.2.5 Design Assistance

Measure ID:

Version Date & Revision History

Draft date: September 20, 2011

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- n/a

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- 12/22/11 – Program requirement changed to require project be in planning or initial design phase.

Description: Design Assistance is available to building owners and their design teams to encourage the implementation of energy efficient building systems. Considering energy efficiency during the initial phases of planning and design greatly increase the feasibility of implementation. Incentives for energy efficiency are project-specific and offered as upfront assistance for additional costs incurred during the design phase. The long-term benefits include energy use reduction for the state of Hawaii and a reduction in operating costs, equipment lifecycle improvement for building owners, and improved comfort for building users.

Program Requirements:

- Application with written pre-approval from Hawaii Energy
- Project in planning or initial design phase
- Total resource benefit ratio greater than or equal to 1

Energy and Demand Savings:

A base case and enhanced case model must be produced with a clear comparison. All assumptions, data, and formulas used in energy efficiency calculations must be clearly documented. Standard engineering principles must be applied, and all references cited. Energy saving calculations shall also reflect the interactive effects of other simultaneous technologies to prevent the overstatement of actual savings. Proposed base and enhanced cases must be performed by a qualified person or firm. In some cases, a professional engineer may be required to provide verification of the analysis.

Savings Algorithms

Gross energy and demand savings estimates for design assistance are calculated using engineering analysis and project-specific details. Custom analyses typically include a weather dependent load bin analysis, whole building energy model simulation, or other engineering analysis and include estimates of savings, costs, and an evaluation of the project's cost-effectiveness.

Baseline Efficiency

The baseline efficiency case assumes compliance with the efficiency requirements as mandated by the Hawaii State Energy Code or industry accepted standard practice.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

High Efficiency

The high efficiency scenario is specific to each project and may include one or more energy efficiency measures. Energy and demand savings calculations are based on comparing a base case analysis and enhanced case analysis on equipment efficiencies and operating characteristics and are determined on a case-by-case basis. The energy efficiency measures must be proven cost-effective, pass total resource benefit, and have a payback greater than or equal to 1.

Persistence Factor

PF = 1 since all custom projects require verification of equipment installation.

Incentives

- Incentive applications are processed on a first-come, first-serve basis
- Incentives are 50% limited to a maximum of \$15,000

13.2.6 Technology & Project Demonstration Assistance

Version Date & Revision History

Draft date: September 20, 2011

Effective date: July 1, 2011

End date: June 30, 2012

Referenced Documents:

- n/a

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- n/a

Description: The Technology and Product Demonstration incentive program seeks emerging technologies that are past the “proof-of-concept” stage and are ready to be demonstrated in an industrial or commercial setting. The objective is to produce proven technical and economic performance data from these demonstrations, which could facilitate the successful deployment of the technologies into the Hawaii marketplace.

Program Requirements:

- Proposals should reflect a comprehensive understanding of the current state of technologies in the chosen area and must provide clear market connections for the proposed technology and potential benefits to electricity ratepayers in Hawaii
- Applicants must propose a team with demonstrated capabilities to successfully complete technology development projects
- Projects must advance state-of-the-art technologies that are not adequately covered by the competitive U.S. market
- After a successful demonstration at an industrial or commercial site, there must be plans for a 1-2 year time frame to commercially deploy the demonstrated technology
- Applicants should address plans for gaining customer acceptance, market development, and deployment in their proposals

Incentives

- Though the program expects to pay an incentive of approximately \$1.00 per kWh saved all applications will be considered on an individual basis and its merit.

14 (BHTR) Business Hard to Reach

14.1 Energy Efficiency Equipment Grants

14.1.1 Water Cooler Timer (H₂Off)

Measure ID:

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- LBNL 2007
- <http://enduse.lbl.gov/info/LBNL-56380%282007%29.pdf>

http://www.energystar.gov/index.cfm?fuseaction=find_a_product.showProductGroup&pgw_code=WA#pecs

TRM Review Actions:

- Currently Under Review.

Major Changes:

- New measure

Measure Description:

Many businesses have water coolers, often equipped with both cold and hot water spigots. Unbeknownst to many, however, is how much energy is used to continuously keep that water hot and cold. Think about it: Water coolers are generally plugged in 24/7, so they're ready and waiting to make a nice cup of hot tea if someone happens to drop by the office at 3 a.m.

Similar to the timers you might use to control lights in your home, plug-in appliance timers allow you to pre-program the times that various appliances in your business are turned on and drawing electricity. So you could pre-program the water cooler so it turns on one hour before the office opens and turns off again after everyone leaves.

Baseline Efficiencies:

No timer

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

| Type of Water Cooler | Energy Usage | |
|----------------------|------------------------|-----------------------|
| | Cold Only (kWh/day) | Hot/Cold (kWh/day) |
| ENERGY STAR | 0.16 | 1.20 |
| Conventional | 0.29 | 2.19 |

Hours per Day 24
Days per year 365

| Base Case Usage | Cold Only | Hot/Cold |
|------------------------------|-----------|----------|
| ENERGY STAR USAGE (kWh/year) | 58 | 438 |
| Conventional (kWh/year) | 106 | 799 |

High Efficiency:

| Enhanced Case Usage | Cold Only | Hot/Cold |
|------------------------------|-----------|----------|
| ENERGY STAR USAGE (kWh/year) | 21 | 157 |
| Conventional (kWh/year) | 38 | 287 |

Energy Savings:

| Energy Savings | Cold Only | Hot/Cold |
|-----------------------------------|-----------|------------|
| ENERGY STAR USAGE (kWh/year) | 37 | 281 |
| Conventional (kWh/year) | 68 | 512 |
| Average Savings (kWh/year) | 53 | 397 |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Energy Savings Assumptions:

It is assumed that half of all water coolers are Energy Star and half are not:

- 50% Energy Star
- 50% Conventional

It is assumed that half of all water coolers are cold only and half are hot + cold dispenser:

- 50% Cold Only
- 50% Hot + Cold

The energy savings figure will be based on the average of the above-mentioned percentages.

Persistence Factor = 90%

Energy Savings = 225 x 90% = 202.5 kWh/year

Demand Savings:

Taking a conservative approach, the demand savings will be based on the following calculation and methodology:

Demand Savings = 225 kWh/year divided by 8760 hrs/year = 0.026 kW

Coincidence Factor = 75%

Note: Based on utilization of 3 of the 4 peak hours (6PM-9PM). 5PM-6PM is not counted since most offices close at 5PM and the timer should be set to turn off cooler 1 hour after office closes which is 6PM.

Coincidence Demand Savings = 0.026 kW x .75 = 0.020 kW

Persistence = 90% (10% of people will disconnect)

Peak Demand Savings = 0.020 kW x .90 = 0.018 kW

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

14.1.2 Small Business Direct Installation - Demand Control Kitchen Ventilation (DCKV)

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Detailed Energy Savings Report, Melink Corporation,
http://www.melinkcorp.com/Intellihood/Energy_Analysis.pdf

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- n/a

Measure Description:

Kitchen ventilation with DCKV hood exhaust. Demand ventilation uses temperature and/or smoke sensing to adjust ventilation rates. This saves energy comparing with the traditional 100% on/off kitchen ventilation system.

Baseline Efficiencies:

Kitchen ventilation without DCKV. Usage per HP:

$$\text{Basecase} = (\text{HP} \times .746 \text{ KW/HP} \times \text{Hours per Year}) / \text{efficiency}$$

| | |
|--|------|
| Basecase fan motor usage per HP (kWh/year) | 4827 |
| Basecase fan motor demand (kW) | 0.83 |

High Efficiency:

Usage per HP:

| | |
|---|------|
| Enhanced case fan motor usage per HP (kWh/year) | 2194 |
| Enhanced case fan motor demand (kW) | 0.38 |

Energy Savings:

The demand control kitchen ventilation savings were determined using the method described in the Melink Detailed Energy Savings Report.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

| | |
|---|------|
| Energy Savings from fan motor per HP (kWh/year) | 2633 |
| Demand Savings from fan motor per HP (kW) | 0.45 |

14.1.3 Low Flow Spray Nozzles for Food Service (Retrofit)

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Evergreen TRM Review – 1/15/14

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- n/a

Measure Description:

All pre-rinse valves use a spray of water to remove food waste from dishes prior to cleaning in a dishwasher. They reduce water consumption, water heating cost, and waste water (sewer) charges. Pre-rinse spray valves include a nozzle, squeeze lever, and dish guard bumper. Energy savings depend on the facility's method of water heating (electric resistance or heat pump). If the facility does not have electric water heating (i.e. gas or propane), there are no electric savings for this measure. The spray valves usually have a clip to lock the handle in the "on" position. Pre-rinse valves are inexpensive and easily interchangeable with different manufacturers' assemblies.

Baseline Efficiencies:

The baseline equipment is assumed to be a spray valve with a flow rate of 2.25 gallons per minute.

High Efficiency:

The efficient equipment is assumed to be a pre-rinse spray valve with a flow rate of 1.28 gallons per minute.

Energy Savings:

$$\Delta \text{kWh} = \Delta \text{Water} \times \text{HOT}_{\%} \times 8.33 \times (\Delta T) \times (1/\text{EFF}^*) / 3413$$

ΔWater = Water savings (gallons)

$\text{HOT}_{\%}$ = The percentage of water used by the pre-rinse spray valve that is heated = 69%

8.33 = The energy content of heated water (Btu/gallon/°F)

ΔT = Temperature rise through water heater (°F) = 65°F

*EFF1 = Water heater thermal efficiency (electric resistance) = 0.98

*EFF2 = Water heater thermal efficiency (heat pump) = 3.0

3413 = Factor to convert Btu to kWh

| Building Type | Operating Schedule (Day/year) | kW Savings | Electric Resistance (kWh/yr) Savings | Heat Pump (kWh/yr) Savings |
|--------------------------|-------------------------------|------------|--------------------------------------|----------------------------|
| Restaurants/Institutions | 365 | 1.03 | 4,753 | 1,553 |
| Dormitories | 274 | 0.9 | 3,568 | 1,165 |
| K-12 Schools | 200 | 0.79 | 2,604 | 851 |

14.1.4 Commercial Ice Makers

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- PG&E Work Paper PGECOFST108 Commercial Ice Machines Revision 3 – May 30, 2012

TRM Review Actions:

- Currently Under Review.

Major Changes:

- New measure

Measure Description:

This measure applies to Energy Efficient air-cooled commercial ice makers in retrofit and new construction applications installed in conditioned spaces. Commercial ice makers are classified into three equipment types; ice-making heads (IMHs), remote condensing units (RCUs) and self-contained units (SCUs). The measure described here applies to ice makers that use a batch process to make cubed ice.

The industry standard for energy use and performance of commercial ice machines is AHRI Standard 810. Key parameters reported for ice makers include the Equipment Type, Harvest Rate (lbs of ice/24hrs) and Energy Consumption Rate. The AHRI Directory of Certified Equipment¹⁵⁰ lists these values by equipment manufacturer and model number.

Baseline and Efficiency Standard:

The Energy Efficient criteria for ice makers define efficiency requirements for both energy and potable water use.

Market Applicability

Hospitals account for 39.4 percent of all commercial icemaker purchases, followed by hotels (22.3 percent), restaurants (13.8 percent), retail outlets (8.5 percent), schools (8.5 percent), offices (4.3 percent), and grocery stores (3.2 percent).

Measure Savings Calculations:

Annual electric savings can be calculated by determining the energy consumed for baseline ice makers compared against ENERGY STAR performance requirements using the harvest rate of the more efficient unit. Peak demand savings can then be derived from the electric savings.

$$\Delta \text{kWh} = (\text{kWh}_{\text{base,per100lb}} - \text{kWh}_{\text{ee,per100lb}}) / 100 \times \text{DC} \times \text{H} \times 365$$

$$\Delta \text{kW} = \Delta \text{kWh} / \text{HRS}$$

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Where:

- 100 = conversion factor to convert kWh_{base,per100lb} and kWh_{ee,per100lb} into maximum kWh consumption per pound of ice.
- DC = Duty Cycle of the ice maker representing the percentage of time the ice machine is making ice
- H = Harvest Rate (lbs of ice made per day)
- 365 = days per year
- kWh = Annual energy savings
- HRS = Annual operating hours
- CF = 1.0

The baseline and energy efficient energy usage per 100lbs of ice produced is dependent on the category of ice maker, as well as the capacity of the energy efficient ice maker. The equations used to determine the energy per 100lbs of ice produced can be seen below.

This incentive applies towards the purchase of new or replacement energy efficient Air-cooled ice machines. Used or rebuilt equipment is not eligible. Customers must provide proof that the appliance meets the energy efficiency specifications listed in Table below.

This specification covers machines generating 60 grams (2 oz.) or lighter ice cubes, as well as flaked, crushed, or fragmented ice machines that meet the Energy Efficiency thresholds by Ice harvest (IHR) rate listed below. Only air cooled machines (icemaker heads, self-contained units, and remote condensing units) are eligible for incentives. Performance data is based on ARI Standard 810.

Energy Efficiency Requirements

| Equipment Type | Ice Harvest Rate Range (lbs of ice/24 hrs) | Energy Efficient Ice Makers | | Federal Minimum Standard Energy Consumption Rate (kWh/100 lbs ice) (H = Harvest Rate) |
|-------------------------|--|--|---|---|
| | | Energy Consumption Rate (kWh/100 lbs ice) (H = Harvest Rate) | Potable Water Use Limit (gal/100 lbs ice) | |
| Ice Making Heads | <450 | $\leq 8.72 - 0.0073H$ | ≤ 20 | $10.26 - 0.0086H$ |
| | ≥ 450 | $\leq 5.86 - 0.0009H$ | ≤ 20 | $6.89 - 0.0011H$ |
| Remote Condensing Units | < 1,000 | $\leq 7.52 - 0.0032H$ | ≤ 20 | $8.85 - 0.0038H$ |
| | $\geq 1,000$ | ≤ 4.34 | ≤ 20 | 5.10 |
| Remote Condensing Units | < 934 | $\leq 7.52 - 0.0032H$ | ≤ 20 | $8.85 - 0.0038H$ |
| | ≥ 934 | ≤ 4.51 | ≤ 20 | 5.30 |
| Self-Contained Units | < 175 | $\leq 15.3 - 0.0399H$ | ≤ 30 | $18.0 - 0.069H$ |
| | ≥ 175 | ≤ 8.33 | ≤ 30 | 9.80 |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

14.1.5 Food Service – Commercial Electric Steam Cooker

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- ENERGY STAR Commercial Kitchen Equipment Savings Calculator: Steam Cooker Calcs.
- PG&E Work Paper PGECOFST104 Commercial Steam Cooker Revision #4 (5/22/12)

TRM Review Actions:

- Currently Under Review.

Major Changes:

- New measure

Measure Description:

The installation of a qualified ENERGY STAR commercial steam cooker. ENERGY STAR steam cookers save energy during cooling and idle times due to improved cooking efficiency and idle energy rates.

Baseline Efficiencies:

The Baseline Efficiency case is a conventional electric steam cooker with a cooking energy efficiency of 30%, pan production of 23.3 pounds per hour, and an idle energy rate of 1.2 kW.

High Efficiency:

The High Efficiency case is an ENERGY STAR electric steam cooker with a cooking energy efficiency of 50%, pan production capacity of 16.7 pounds per hour, and an idle energy rate of 0.4 kW.

Energy Savings:

Unit savings are deemed based on study results:

| | |
|-------------------|-----------------|
| Δ kWh/year | = 3,258 kWh/pan |
| Δ kW | = 2.23 kW |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

14.1.6 Food Service – Commercial Electric Griddle

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- The industry standard for energy use and cooking performance of griddles are ASTM F1275-03: Standard Test
- Method for the Performance of Griddles and ASTM F1605-01: Standard Test Method for the Performance of Double-Sided Griddles
- ENERGY STAR Commercial Griddles Program Requirements Version 1.1, effective May 2009 for gas griddles and effective January 1, 2011 for electric.
- Database for Energy Efficient Resources, 2008,
http://www.deeresources.com/deer0911planning/downloads/EUL_Summary_10-1-08.xls
- Assumptions based on PG&E Commercial Griddles Work Paper developed by FSTC, May 22, 2012.

TRM Review Actions:

- Currently Under Review.

Major Changes:

- New measure

Measure Description:

This measure applies to ENERGY STAR or equivalent electric commercial griddles in retrofit and new construction applications. This appliance is designed for cooking food in oil or its own juices by direct contact with either a flat, smooth, hot surface or a hot channeled cooking surface where plate temperature is thermostatically controlled.

Energy-efficient commercial electric griddles reduce energy consumption primarily through the application of advanced controls and improved temperature uniformity.

Baseline and Efficiency Standard

Key parameters for defining griddle efficiency are Heavy Load Cooking Energy Efficiency and Idle Energy Rate. There are currently no federal minimum standards for Commercial Griddles, however, the American Society of Testing and Materials (ASTM) publishes Test Methods 155 that allow uniform procedures to be applied to each commercial cooking appliance for a fair comparison of performance results.

ENERGY STAR efficiency requirements apply to single and double sided griddles. The ENERGY STAR criteria should be reviewed on an annual basis to reflect the latest requirements.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

ENERGY STAR Criteria for Electric Single and Double Sided Griddles

| Performance Parameters | Electric Griddles |
|--------------------------------------|--------------------------------------|
| Heavy-Load Cooking Energy Efficiency | $\geq 70\%$ |
| Idle Energy Rate | ≤ 320 watts per ft ² |

Energy Savings:

Annual savings can be calculated by determining the energy consumed by a standard efficiency griddle as compared with an ENERGY STAR rated griddle.

$$\Delta \text{kWh} = \text{kWh}(\text{base}) - \text{kWh}(\text{eff})$$

$$\Delta \text{kWh}(\text{base or eff}) = \text{kWh}(\text{cooking}) + \text{kWh}(\text{idle}) + \text{kWh}(\text{preheat})$$

$$\text{kWh}(\text{cooking}) = [\text{LB}(\text{food}) \times \text{E}(\text{food}) / \text{Cook}(\text{eff})] \times \text{Days}$$

$$\text{kWh}(\text{idle}) = \text{IdleEnergy} \times [\text{DailyHrs} - \text{LB}(\text{food}) / \text{Capacity} - \text{PreheatTime} / 60] \times \text{Days}$$

$$\text{kWh}(\text{preheat}) = \text{PreheatEnergy} \times \text{Days}$$

| Parameter | Description | Value | Source |
|----------------|-------------------------------|-----------------|-------------------|
| Daily Hrs | Daily Operating Hours | 12 hours | FSTC |
| Preheat Time | Time to Preheat (min) | 15 min | FSTC |
| E(food) | ASTM defined Energy to Food | 0.139 kWh/lb | FSTC |
| Days | Number of days of operation | 365 days | FSTC |
| CookEff | Cooking energy efficiency (%) | See Table below | FSTC, ENERGY STAR |
| IdleEnergy | Idle energy rate (kW) | | FSTC |
| Capacity | Production capacity (lbs/hr) | | FSTC |
| Preheat Energy | kWh/day | | FSTC |
| LB(food) | Food cooked per day (lb/day) | | FSTC |

General assumptions used for deriving deemed electric savings are values taken from the Food Service Technology Center (FSTC) work papers. These deemed values assume that the griddles are 3 x 2 feet in size. Parameters in the table are per linear foot, with an assumed depth of 2 feet.

Baseline and Efficient Assumptions for Electric Griddles

| Parameter | Baseline Electric Griddles | Efficient Electric Griddles |
|--------------------------------|----------------------------|-----------------------------|
| Preheat Energy (kWh/ft) | 1.33 | 0.67 |
| Idle Energy Rate (kW/ft) | 0.80 | 0.64 |
| Cooking Energy Efficiency (%) | 65% | 70% |
| Production Capacity (lbs/h/ft) | 11.7 | 16.33 |
| Lbs of food cooked/day/ft | 33.33 | 33.33 |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

| Base (kWh/year) per linear foot | |
|--------------------------------------|-------------|
| Cooking | 2602 |
| Idle | 2599 |
| Preheat | 485 |
| Total Base Energy Usage (kWh) | 5686 |
| Demand (kW) | 1.30 |

| Efficient (kWh/year) per linear foot | |
|---|-------------|
| Cooking | 2416 |
| Idle | 2268 |
| Preheat | 245 |
| Total Efficient Energy Usage (kWh) | 4928 |
| Demand (kW) | 1.13 |

| | |
|--|-------------|
| Energy Savings (kWh/year) per linear foot | 758 |
| Demand Savings (kW) | 0.17 |

Operating Hours

The average steam cooker is assumed to operate 4,380 hours per year.

Demand Coincidence Factor

Coincidence factor is 1.0 because the cooking equipment is assumed to operate throughout the on-peak demand periods (5PM – 9PM).

Persistence

100% persistence factor

Lifetime

12 years – DEER (2008)

Measure Costs and Incentive Levels

Incremental cost = \$774

(Assumptions based on PG&E Commercial Griddles Work Paper developed by FSTC, May 22, 2012).

Incentive = \$

14.1.7 Food Service – Commercial Fryer

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- The industry standards for energy use and cooking performance of fryers are ASTM Standard Test Method for the Performance of Open Deep Fat Fryers (F1361) and ASTM Standard Test Method for the Performance of Large Vat Fryers (FF2144).
- ENERGY STAR Version 2.0, effective April 22, 2011
- Assumptions based on PG&E Commercial Fryers Work Paper developed by FSTC, June 13, 2012

TRM Review Actions:

- Currently Under Review.

Major Changes:

- New measure

Measure Description:

This measure applies to ENERGY STAR or its equivalent electric commercial open-deep fat fryers in retrofit and new construction applications. Commercial fryers consist of a reservoir of cooking oil that allows food to be fully submerged without touching the bottom of the vessel. Electric fryers use a heating element immersed in the cooking oil. High efficiency standard and large vat fryers offer shorter cook times and higher production rates through the use of heat exchanger design. Standby losses are reduced in more efficient models through the use of fry pot insulation.

Baseline and Efficiency Standard

Key parameters for defining fryer efficiency are Heavy Load Cooking Energy Efficiency and Idle Energy Rate. ENERGY STAR requirements apply to a standard fryer and a large vat fryer. A standard fryer measures 14 to 18 inches wide with a vat capacity from 25 to 60 pounds. A large vat fryer measures 18 inches to 24 inches wide with a vat capacity greater than 50 pounds. The ENERGY STAR criteria should be reviewed on an annual basis to reflect the latest requirements.

There are currently no federal minimum standards for Commercial Fryers, however, the American Society of Testing and Materials (ASTM) publishes Test Methods¹⁸³ that allow uniform procedures to be applied to each commercial cooking appliance for a fair comparison of performance results.

ENERGY STAR Criteria and FSTC Baseline for Open Deep-Fat Electric Fryers

| Performance Parameters | ENERGY STAR Electric Fryer Criteria | |
|--------------------------------------|-------------------------------------|-----------------------|
| | Standard Fryers | Large Vat Fryers |
| Heavy-Load Cooking Energy Efficiency | $\geq 80\%$ | $\geq 80\%$ |
| Idle Energy Rate | $<+ 1.0 \text{ kW}$ | $\leq 1.1 \text{ kW}$ |

Energy Savings:

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Annual savings can be calculated by determining the energy consumed by a standard efficiency fryer as compared with an ENERGY STAR rated fryer.

$$\Delta \text{kWh} = \text{kWh}(\text{base}) - \text{kWh}(\text{eff})$$

$$\Delta \text{kWh}(\text{base or eff}) = \text{kWh}(\text{cooking}) + \text{kWh}(\text{idle}) + \text{kWh}(\text{preheat})$$

$$\text{kWh}(\text{cooking}) = [\text{LB}(\text{food}) \times \text{E}(\text{food}) / \text{Cook}(\text{eff})] \times \text{Days}$$

$$\text{kWh}(\text{idle}) = \text{IdleEnergy} \times [\text{DailyHrs} - \text{LB}(\text{food}) / \text{Capacity} - \text{PreheatTime} / 60] \times \text{Days}$$

$$\text{kWh}(\text{preheat}) = \text{PreheatEnergy} \times \text{Days}$$

| Parameter | Description | Value | Source |
|----------------|-------------------------------|-----------------|-------------------|
| Daily Hrs | Daily Operating Hours | 12 hours | FSTC |
| Preheat Time | Time to Preheat (min) | 15 min | FSTC |
| E(food) | ASTM defined Energy to Food | 0.167 kWh/lb | FSTC |
| Days | Number of days of operation | 365 days | FSTC |

(Assumptions based on PG&E Commercial Fryers Work Paper developed by FSTC, May 22, 2012).

Incentive = \$

14.1.8 Hot Food Holding Cabinet

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- PG&E Work Paper PGEFST105 (Revision 3) – June 8, 2012

TRM Review Actions:

- Currently Under Review.

Major Changes:

- New measure

Measure Description:

Commercial insulated hot food holding cabinet models that meet program requirements incorporate better insulation, reducing heat loss, and may also offer additional energy saving devices such as magnetic door electric gaskets, auto-door closures, or dutch doors. The insulation of the cabinet also offers better temperature uniformity within the cabinet from top to bottom. This means that qualified hot food holding cabinets are more efficient at maintaining food temperature while using less energy.

- **Full-size holding cabinets** are defined as any holding cabinet with an internal measured volume of greater than or equal to 15 cubic feet (≥ 15 ft.³). This measure does not include cook-and-hold equipment. All measures must be electric hot food holding cabinets that are fully insulated and have doors. Qualifying cabinets must not exceed the maximum idle energy rate of 20 Watts per cubic foot in accordance with the ASTM Standard test method.
- **Half-size holding cabinets** are defined as any holding cabinet with an internal measured volume of less than 15 cubic feet (< 15 ft.³). This measure does not include cook-and-hold or retherm equipment. All measures must be electric hot food holding cabinets that are fully insulated and have doors. Qualifying cabinets must not exceed the maximum idle energy rate of 20 Watts per cubic foot in accordance with the ASTM Standard test method.

Baseline Efficiency:

The baseline equipment is assumed to be a standard hot food holding cabinet with an idle energy rate of 40 watts per cubic foot.

High Efficiency:

The efficient equipment is assumed to be an ENERGY STAR qualified hot food holding cabinet with an idle energy rate of 20 watts per cubic foot.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Energy Savings:

Energy usage calculations are based on 15 hours a day, 365 days per year operation at a typical temperature setting of 150°F. The different sizes for the holding cabinets (half size and full size) have proportional operating energy rates. Operating energy rate for the full size holding cabinets was obtained in accordance with the ASTM Standard.

The energy savings calculations listed in the following tables use Title 20 (California) as the baseline for potential energy savings requiring all hot food holding cabinets sold in California to meet a normalized idle energy rate of 40 Watts/ft³.

Insulated Hot Food Holding Cabinet - Full Size

| Performance | Baseline | High Efficiency Qualifying Model |
|----------------------------------|----------|----------------------------------|
| Demand (kW) | 1 | 0.28 |
| Annual Energy Use (kWh/year) | 5475 | 1533 |
| Estimated Demand Reduction (kW) | - | 0.72 |
| Annual Energy Savings (kWh/year) | - | 3942 |
| Incremental Measure Cost (\$) | | 2336 |
| Estimated Useful Life (years) | 12 | 12 |

Insulated Hot Food Holding Cabinet - Half Size

| Performance | Baseline | High Efficiency Qualifying Model |
|----------------------------------|----------|----------------------------------|
| Demand (kW) | 0.38 | 0.05 |
| Annual Energy Use (kWh/year) | 2081 | 274 |
| Estimated Demand Reduction (kW) | - | 0.33 |
| Annual Energy Savings (kWh/year) | - | 1807 |
| Incremental Measure Cost (\$) | | 381 |
| Estimated Useful Life (years) | 12 | 12 |

The demand reduction estimation is based on measured data for standard efficiency insulated holding cabinets and for high-efficiency insulated holding cabinets. The measured data are derived from tests conducted under ASTM Standard Test Method for the Performance of Hot Food Holding Cabinets.

Measure ASTM test results for Hot Food Holding Cabinets

| Cabinet Size | Cabinet Volume (ft ³) | Normalized Idle Energy Rate (W/ft ³) | Total Cabinet Idle Energy Rate (W) |
|--------------|-----------------------------------|--|------------------------------------|
| Full-Size | 25 | 11.3 | 0.28 |
| Half-Size | 10 | 5.7 | 0.05 |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Operating Hours

15 hr/day, 365 day/year = 5,475 hours/year

Demand Coincidence Factor

CF = 1.0

Lifetime

12 years

Measure Costs and Incentive Levels

The incremental cost for ENERGY STAR hot food holding cabinet is \$2,336 (full size) & \$381 (half size)

- Incentive (Full Size) = \$250 (\$0.063/kWh)
- Incentive (Half Size) = \$150 (\$0.083/kWh)

14.1.9 Commercial Kitchen Combination Ovens

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

TRM Review Actions:

- Currently Under Review.

Major Changes:

- New measure

Measure Description:

Commercial combination ovens offer the ability to steam food in the oven cavity. These ovens are capable of steaming, proofing and reheating various food products in addition to the normal functions of baking and roasting. Foods can be cooked in a variety of ways: in a convection oven dry heat only mode, a steam only mode, and a combination of dry heat and steam modes. Food to be cooked partially in one mode at a certain temperature and then finished in another mode and at a separate temperature by utilizing the programmability of combination ovens. Combination ovens range in size from 6 pan countertop models up to 40 pan stand-alone models.

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Baseline Efficiency:

TRM Review Actions:

- Currently Under Review.

Major Changes:

- New measure

Measure Description:

Commercial convection ovens are widely used in the foodservice industry and have a wide variety of uses from baking and roasting to warming and reheating. Convection ovens are also used for nearly all types of food preparation, including foods typically prepared using other types of appliances (e.g., griddles, fryers, etc.). ENERGY STAR commercial ovens are about 20 percent more energy efficient than standard models.

- **Full-size electric convection ovens** are defined by the ability to accept a minimum of five (5) standard full-size sheet pans (18 in. x 26 in. x 1 in.). Qualifying ovens must meet Energy Star requirements by having a tested heavy-load (potato) cooking efficiency in accordance with ASTM F1496. Cooking energy efficiency must be greater than or equal to 70 percent ($\geq 70\%$) and must not exceed the maximum idle energy rate of 1.6 kW ($\leq 1.6\text{kW}$).
- **Half-size electric convection ovens** are defined by the ability to accept a minimum of five (5) sheet pans measuring (18 in. x 13 in. x 1 in.). Qualifying ovens must meet Energy Star requirements by having a tested heavy-load (potato) cooking efficiency in accordance with ASTM F1496. Cooking energy efficiency must be greater than or equal to 70 percent ($\geq 70\%$) and must not exceed the maximum idle energy rate of 1.0 kW ($\leq 1.0\text{kW}$).

14.1.11 Commercial Solid Door Refrigerators & Freezers

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- Southern California Edison Work Paper SCE13CC001 Commercial Reach-In Refrigerators and Freezers – April 6, 2012

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- New measure

Measure Description:

This measure relates to the installation of a new reach-in commercial refrigerator or freezer meeting ENERGY STAR efficiency standards. ENERGY STAR labeled commercial refrigerators and freezers are more energy efficient because they are designed with components such as ECM evaporator and condenser fan motors, hot gas anti-sweat heaters, or high-efficiency compressors, which will significantly reduce energy consumption. This measure could relate to the replacing of an existing unit at the end of its useful life, or the installation of a new system in a new or existing building.

Baseline Efficiencies:

In order for this characterization to apply, the baseline equipment is assumed to be a solid or glass door refrigerator or freezer meeting the minimum federal manufacturing standards.

High Efficiency:

In order for this characterization to apply, the efficient equipment is assumed to be a solid or glass door refrigerator or freezer meeting the minimum ENERGY STAR efficiency level standards.

Energy Savings:

$$\text{Annual Energy Savings (kWh/year)} = (\text{kWh}_{\text{base}} - \text{kWh}_{\text{ee}}) * 365$$

$$\text{Demand Savings} = \text{Annual Energy Savings} / \text{HOURS} * \text{CF}$$

Baseline Energy Usage

| Type | kWh _{base} |
|-------------------------|---------------------|
| Solid Door Refrigerator | $0.10 * V + 2.04$ |
| Glass Door Refrigerator | $0.12 * V + 3.34$ |
| Solid Door Freezer | $0.40 * V + 1.38$ |
| Glass Door Freezer | $0.75 * V + 4.10$ |

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

Energy Efficient Usage

| Equipment Description (cubic feet) | kWhe Daily Energy Usage (kWh/day) |
|---|---|
| Solid-Door Reach-In Refrigerator | |

14.1.12 Small Business Direct Restaurant Lighting Retrofits

Version Date & Revision History

Draft date:

Effective date: July 1, 2013

End date: June 30, 2014

Referenced Documents:

- n/a

TRM Review Actions:

- 10/5/11 – Currently Under Review.

Major Changes:

- n/a

Measure Description:

The program targets customers within the small business market. Typically this market has limited time and expertise within their organizations to research lighting technology options, obtain financing and contract with lighting contractors to replace their older less efficient lighting technologies. The Small Business Lighting Retrofit provides a “Turnkey” program consisting of audits, fixed pricing, installation by participating Hawaii Energy contractors and 4 month financing of lighting retrofits.

Program Requirements:

Small Business Restaurant Customers - TBD

Hawaii Energy - Technical Reference Manual No. 2013

Program Year 5 July 1, 2013 to June 30, 2014

East Maui teens, residents benefit from solar training

July 8, 2013

By MELISSA TANJI - Staff Writer (mtanji@mauinews.com) , The Maui News

With a mere 30 solar water heating systems in Hana, a program teaching students how to install the systems and educate them about its benefits could prompt more East Maui residents to invest in alternative energy, with proponents saying that a household could save as much as 40 percent on its electric bill with the systems.

Ala Moana Hotel invests in energy management system

Jul 10, 2013, 12:33pm HST

[Jenna Blakely](#)

Reporter- *Pacific Business News*

[The Ala Moana Hotel](#) recently invested in an \$800,000 energy management system that equips its rooms with sensors that automatically lower room temperature when guests leave, reducing energy consumption.

The system was funded by the Ala Moana Hotel's Association of Apartment Owners, which received a \$125,800 rebate from Hawaii Energy to offset costs.

Called the [Inncom system](#), the sensors were placed in all 1,176 guest rooms at the Ala Moana Hotel.

"With the new Inncom system in place, Ala Moana Hotel is making strides to complete its green energy master plan," General Manager [Dave Lawrence](#) said in a statement.

The hotel has also installed \$500,000 worth of energy efficient lighting and has tinted some of its windows to conserve energy.

Hawaii Energy works to improve state's efficiency

POSTED: 01:30 a.m. HST, Jul 14, 2013

Question: What are the origins of Hawaii Energy, and what is its mission?

Answer: Hawaii Energy is the state's energy conservation and efficiency program, funded by electric utility ratepayers for the benefit of ratepayers. We serve the counties of Hawaii, Honolulu and Maui under the direction of the Hawaii Public Utilities Commission.

Our core mission is to educate, motivate and incentivize electric utility customers to adopt energy conservation and efficiency measures to save electricity and reduce Hawaii's dependence on imported fuels.

Q: Is Hawaii on track to meet the energy efficiency goals spelled out in the Hawaii Clean Energy Initiative?

A: The program plays an important role in helping to achieve Hawaii's goal of reducing total electric energy usage by 30 percent or 4.3 billion kilowatt-hours by 2030. To date, we are on track to reach and quite possibly exceed this goal. However, our work is far from over. Our efforts must continue to reduce the demand for Hawaii's limited resources.

Q: People may know Hawaii Energy for the rebates it provides for compact fluorescent lights and energy-efficient appliances, but it also conducts education and outreach programs. How is that effort going?

A: Hawaii Energy is making significant progress with our transformational program's wide range of educational and training opportunities, which are offered throughout the year for underserved population segments, teachers and energy professionals.

Q: Hawaii Energy works with both residential and commercial utility customers. Which area has greater potential to reduce Hawaii's overall energy consumption?

A: Commercial energy-efficiency efforts, with support from Hawaii Energy incentives, make a significant impact due to their size and volume. We work with businesses big and small — ranging from hotels to mom-and-pop stores — to see how we can reduce their electric bill and increase their bottom line with energy-efficient technology.

That said, without the participation and support of residential customers, we will not meet our energy efficiency goals.

Q: Is it true that installing a solar water heater is the largest single energy efficiency improvement homeowners can undertake to cut their electricity bill?

A: Yes. A typical home's largest energy consumer is the electric water heater — if the household doesn't have air conditioning or a swimming pool. When a household of four or more switches to a solar water heater, it can save up to 40 percent, at least \$600 a year, on its electric bill. Hawaii Energy's limited-time \$1,000 instant rebate, combined with applicable state and federal tax credits, reduces the cost of the average solar water heating system from approximately \$6,600 to about \$2,000.

Q: What are some of the other, less obvious ways that homeowners can reduce their electricity usage?

A: There are several low-cost and no-cost things people can do today to save on their electric bill. People still waste a significant amount of electricity that they do not need to use. Here are some solutions:

>> Replace old-fashioned incandescent light bulbs with energy-saving compact fluorescent lights or light-emitting diodes. We provide instant rebates for both at various local retailers. No coupons or forms are needed since the prices factor in the rebate.

>> Turn off lights, computers, televisions and other electronics when you are not using them. Or, use a power strip so you can easily turn off multiple devices.

>> Instead of using the air conditioner, open your windows to capture our breezy tradewinds. If you need more cooling, try fans instead of the air conditioner.

Solar company incentives to lure customers not exactly free

HONOLULU —The warning about "free gifts" has been on the form for Hawaii's renewable energy income tax credit since 2009. However, incentives from solar energy contractors haven't been an issue until recently as competition in the booming industry heats up.

According to the Department of Business, Economic Development and Tourism, the total value of residential photovoltaic permits has reached \$189.9 million so far this year, a 3.9 percent decrease from the same time period in 2012.

With the money pot shrinking, some solar companies have begun offering complimentary iPads or free trips to Las Vegas to entice new customers.

"We're seeing them because the market is really competitive right now," said Leslie Cole-Brooks, executive director of the Hawaii Solar Energy Association. "People really want to install solar, their electric rates are high (and) they want to protect the environment."

But taking that trip for two to Sin City or getting your hands on a new tablet will cost you in the end. The Tax Department says the cost of freebies must be deducted from the overall cost of a solar hot water heater or PV system.

"For taxpayers applying for the renewable energy technologies income tax credit, it is important for them to understand that the value of any free gifts or incentives provided to them by a solar company will be subtracted from the total cost of the qualified solar energy system," Hawaii Deputy Tax Director Joshua Wisch said in a statement to KITV4.

Wisch provided the following scenario as an example:

If a taxpayer installs a system that costs \$20,000, but as an incentive for installation the taxpayer receives a trip to Las Vegas that is valued at \$5,000, then the actual cost of the solar energy system, for purposes of the credit, will be \$15,000.

Jeff Davis, known as The Solar Guy on his daily KGU radio show Hawaii's Tomorrow, is concerned some taxpayers may be caught off-guard when preparing their income tax forms at the end of the year.

"Free iPads, free trips to Vegas, free 15,000 miles, or perhaps even an air conditioner - all that must be removed from your invoice before determining your tax credits, and if you do not, your accountant should catch it," said Davis. "If your accountant doesn't catch it, both the client and the accountant are going to be involved in tax fraud with the IRS and the state of Hawaii tax office."

Currently, Hawaii offers a 35 percent tax credit on solar energy systems up to \$5,000. The federal government provides a separate 30 percent credit for each qualifying system, with no maximum amount.

Cole-Brooks says homeowners who are contemplating a switch to solar energy should not shy away from contractors offering free trips or other special incentives. However, she stresses customers should be aware of the tax implications and do their homework.

For instance, Hawaii Energy's \$1,000 rebate for the installation of a hot water will count against the overall price of the system when calculating the tax credit.

"Just think about it like anything," said Cole-Brooks. "Be a well-informed consumer with your feet on the ground."

Hawaii Energy program promotes ‘energy literacy’ to teachers

Hawaii Energy, the state’s conservation and energy efficiency program, recently sent three Hawaii teachers to a national conference in New Mexico for the National Energy Education Development project.

[Kuulei Tengan](#) from Kalihi-Waena Elementary School, [Jeffrey Palmer](#) of Kilohana Elementary School and [Lisa Palmer](#) of Kilohana Elementary School attended the national event, according to a statement.

The National Energy Education Development project, or NEED, is a program that promotes green energy education by rallying together students, educators, business, government and community leaders to come up with energy education programs. More than 65,000 classrooms across the nation use NEED’s curriculum, and teachers who sign up as members for \$35 receive curriculum updates each year.

[Hawaii Energy](#), under contract with the Hawaii Public Utilities Commission, has been supporting participation in NEED on the local level. The organization has sponsored 14 NEED workshops in the Aloha State since 2011 and plans to do more workshops in the fall. Hawaii Energy funds teacher participation in these workshops, which have taught more than 520 teachers in Hawaii, to date. Hawaii Energy has also provided subsidies to send 11 teachers, including this year’s three teachers, to NEED’s national conference.

“As part of our mission to improve energy literacy in Hawaii, it is important that we support programs like this,” said [Chelsea Harder](#), transformational program management specialist at Hawaii Energy, in a statement. “This year’s national conference provided Kuulei, Jeffrey and Lisa with the opportunity to explore many aspects of the NEED curriculum with guidance from veteran NEED teachers, collaboration with other teachers and networking with educators and energy professionals around the country.”

Hawaii Energy recently launched a Teacher Advisory Board comprised of local teachers to discuss and give feedback about how to integrate and raise awareness to more local teachers about the NEED program. Teachers who participate in NEED are eligible for educational grants up to \$2,500 to help teachers implement conservation projects and activities.

Ilikai residents get rebate for installing energy-metering system

Hawaii Energy, the state's energy-conservation program, presented a \$153,000 rebate check to the Owners of Ilikai Apartment Building Inc. on Thursday as part of the installation of a \$430,000 system designed to more fairly allocate the cost of electricity and encourage occupants of each unit to conserve energy.

The new submetering system is expected to save the Ilikai property about \$270,000 and 995,000 kilowatt hours per year.

"Electricity submeters allow apartment and condo residents to know exactly how much electricity they are utilizing, and help reward those who conserve with lower electric bills," Hawaii Energy Program Director [Ray Starling](#) said in a statement. "It's a simple way to raise awareness, reduce energy use and save money on monthly bills. I encourage businesses and residents to visit our website to learn more about submetering and the many other incentive opportunities we offer."

[John Popovich](#), general manager for the Ilikai, said its owners and guests benefit directly from improvements that make it a more energy-efficient building.

"In addition to submetering, we are considering other measures, including split-system variable refrigerant flow air-conditioning systems and energy management guest room controls," he said in a statement.

[Jeff Dickinson](#), vice president and senior property manager for Hawaii an Properties Ltd., worked with [Lisa Harmon](#), business program specialist at Hawaii Energy, to procure the \$153,000 rebate on behalf of the AOA Ilikai.

Hawaii Energy said it offers an incentive of \$150 per unit (up to 50 percent of the total project cost) for submeters used for billing. Depending on the property and the occupants' willingness to change their behavior, electricity reduction can range from 3 percent to 25 percent.

Saving energy wins Waikiki hotel more than \$119K

*Posted: Aug 14, 2013 7:08 AM
Updated: Aug 14, 2013 7:08 AM*

By Ian Scheuring - [bio](#) | [email](#)

HONOLULU (AP) - A Waikiki hotel is receiving more than \$119,000 as a reward for installing energy efficient air conditioning systems and lights.

The conservation and energy efficiency program Hawaii Energy says the Courtyard Marriott Waikiki Beach retrofitted 400 guestrooms with air conditioning systems that turn off automatically when the rooms aren't occupied.

A switch also turns off the room's air conditioning when a lanai door is open. The hotel replaced less efficient halogen lamps in guestroom corridors with high performance and long-lasting light emitting diode lamps.

Hawaii Energy on Tuesday presented the hotel with a check for more than \$119,000. It says the hotel will also likely save about \$190,000 in electricity costs each year.

Hawaii's electric utility customers pay for the Hawaii Energy program.

Courtyard by Marriott Waikiki Beach gets money back for saving energy

Aug 14, 2013, 2:33pm HST

Courtesy Hawaii Energy

Members of the Courtyard by Marriott Waikiki Beach pose with a check from Hawaii Energy that the hotel received for several energy-saving installations completed this spring. Top row, from left: Shannon Amaral, Jefferson Pascual, Juvanny Guittap, David Pangayan, Jody Munetake, and Lily Koo of Hawaii Energy. Kneeling, from left: Rostin Honda, Christopher Michaels.

Hawaii Energy, the state's energy conservation program, presented a \$119,836 incentive check to the Courtyard by Marriott Waikiki Beach for several energy-saving installations completed this spring.

The installations include split air-conditioning systems, a variable frequency drive for the pool pump, light-emitting diode lamps in guest corridors and guestroom air-conditioning energy management control systems.

In total, all four projects are estimated to save the hotel about \$190,000 in electricity costs and 620,555 kilowatt hours per year, [Hawaii Energy](#) said.

"We applaud Marriott's proactive approach to managing the hotel's energy use," Hawaii Energy Program Director [Ray Starling](#) said in a statement. "With the completion of several projects, the

Marriott has taken great strides toward energy efficiency [and] we encourage other hotels and businesses to consider participating in our incentive offerings.”

All of the 400 guestrooms in both the Kuhio and Royal Hawaiian Towers have been retrofitted with integrated guestroom air-conditioning energy management systems, which sense the occupancy status of the room with a motion sensor.

These systems allow the air-conditioning to be automatically turned off when the room is not occupied. There’s also a lanai door switch that turns off the unit when the door is open.

The estimated savings of this retrofit is 321,965 kilowatt hours per year, Hawaii Energy said.

The Courtyard by Marriott Waikiki Beach isn’t the only property in Waikiki getting an efficiency makeover by Hawaii Energy.

Just last week, the Owners of Ilikai Apartment Building Inc. were presented with a \$153,000 rebate check as part of the installation of a \$430,000 system designed to more fairly allocated the cost of electricity and encourage residents to conserve energy.

COVERING **NONPROFITS AND GENERAL BUSINESS NEWS**

FOUR QUESTIONS FOR RAY STARLING

Hawaii Energy Program Director Ray Starling drives what he preaches. He's standing in front of his electric car.

COURTESY RAY STARLING

Ray Starling is program director for Hawaii Energy, the state's conservation and efficiency program. Its mission is to assist both residents and businesses in adopting renewable-energy practices, with help from rebates and other incentives. It serves the Honolulu, Hawaii and Maui counties and is administered by the Science Applications International Corp. under contract with the Hawaii Public Utilities Commission.

What is the hardest part of your job?

The toughest part of my job is trying to leverage a limited budget to make maximum impact on energy consumers, particularly those who have been historically underserved by the energy-efficiency program.

Where do Hawaii businesses stand in going green? Are we behind, okay, or ahead of the curve?

Some businesses are way ahead, mostly large, professionally managed facilities that understand the value of conservation and efficiency

and want to make it a profit center. However, others are way behind. These are the hard-to-reach customers who struggle from month to month and do not generally have discretionary funds to invest in the future. But we have these businesses in our sights now with the Hawaii Public Utility Commission's on-bill financing program being developed for implementation early in 2014. Stay tuned!

With as many education efforts as there are about going green, how is general community awareness today?

We have made significant progress, but we still are not where we need to be with energy conservation and efficiency. That said, with outreach partners like Blue Planet Foundation, Hawaii Energy Policy Forum, Kanu Hawaii and KUPU, we are making great headway.

What's in your fridge?

An Energy Star label, and a cold Heineken or two.

Vendors of water cooler timers sought

Hawaii Energy, the energy efficiency and conservation program for Hawaii, Honolulu and Maui counties, is calling for vendors to participate in a new upstream water cooler timer business.

The offering, slated to launch this fall, will be available to businesses that are on commercial electricity rate schedules P, J or G.

“Our goal for this upcoming offering is two-fold,” said Ray Starling, the program’s director. “We want to promote simple, yet practical measures such as timer installations that can help businesses instantly achieve savings on their electric bills. Additionally, we hope that the adoption of energy saving behaviors will extend from the workplace to households across the state.”

Many businesses have water coolers plugged in 24 hours a day, seven days a week. A standard hot and cold water cooler can use more electricity than a large refrigerator. Installing a plug-in timer can reduce electricity use by up to 50 percent, or about 350 kilowatt hour, annually, which is more than \$100 in electricity cost per year based on 30 cents per kilowatt hour).

Similar to timers used to control lights in a home, plug-in appliance timers allow for preprogramming of times when various appliances are turned on. For example, a water cooler timer can be pre-programmed to turn on one hour before the office opens and turn off when the office closes for the day.

For vendors to participate in this upcoming offering, the timers must be digital, as well as include an internal rechargeable battery and seven-day programmable on and off settings. Timer vendors will be responsible for identifying and contracting directly with water cooler companies to install timers on customer water coolers. Installation of the timers will be incentivized 100 percent by Hawaii Energy (up to \$15 per timer).

For more information, call 839-8880 or (877) 231-8222.

Hawaii Guard saves green by going green

*Posted: Sep 19, 2013 5:53 PM
Updated: Sep 19, 2013 5:55 PM*

By Lynn Kawano - [email](#)

A few simple changes have resulted in big savings for the Hawaii National Guard.

A pilot program to make the facilities more energy efficient has saved almost \$80,000 in a year.

20 buildings were altered last summer. Fluorescent bulbs were removed from some of the light fixtures, high powered lights were made compatible with more efficient bulbs, and the air conditioners were turned down.

"We actually like it about 74-75 (degrees) and that's great... you get real dollar savings," says Derek Sonoda of Hawaii Energy, the company that worked with the Guard on the pilot program.

A joint press conference was held Thursday morning at the 22nd Avenue Armory to show off the ways they've brought energy usage down.

"Of course it's saving tax dollars, no question about that," says Governor Neil Abercrombie, "This is green government."

The Hawaii Guard is now expanding the program to other buildings.

The changes have brought down energy usage by 7%, they hope to eventually bring that down by 25%.

Refrigerator exchange expected to cut electric bills on Molokai

By Star-Advertiser Staff

A group of 60 Molokai households are expected to save nearly \$400 a year on their electricity bills thanks to a program that allowed them to exchange their old refrigerators for a high-efficiency model at a discounted price.

Households were able to purchase Energy Star-approved refrigerators at a cost of \$250 under the Hui Up! 2013 program run by Blue Planet Foundation, Hawaii Energy and Sustainable Molokai. The new refrigerators were delivered and the old ones hauled away at no charge to program participants.

The new refrigerators are expected to cut the electric bill of each participating household by an average of \$374 a year, according to a news release from Blue Planet. The residential electric rate on Molokai is about 46 cents a kilowatt hour, roughly 40 percent higher than the residential rate on Oahu.

There are plans to extend the Hui Up! 2013 program to as many as 300 households on Molokai, according to the news release.

Molokai Fridge Swap

October 21st, 2013

By Nina Wu

Let's hear it for brand-new, energy-efficient fridges on the Friendly Isle!

A total of 60 EnergyStar refrigerators were delivered to Molokai residents earlier this week as part of [Hui UP! 3.0](#), an appliance exchange program offered through a partnership between [Blue Planet Foundation](#), [Hawaii Energy](#) and [Sust'AINable Moloka'i](#).

Molokai residents were able to swap in their old fridges for a high-efficiency model for just \$250, considerably less than retail prices. Pick up of old fridges, recycling and home delivery was included.

Francois Rogers, Blue Planet's special projects director, says the foundation is hoping to reach as many as 300 households on Molokai.

Sust'AINable Molokai helped with on-the-ground logistics, with help from Sears, Makoa Trucking, Island Movers and Refrigerant Recycling.

The Hui Up! program is a follow up to a CFL exchange program that replaced 36,000 incandescent bulbs on Molokai with Compact Fluorescent Lamps. As part of Hui Up! students from the Sust'AINable Molokai Youth Energy Team will visit the households and using hand-held energy monitors, they will measure the differences in energy usage.

Participants are expected to save an average of \$374 a year (based on Molokai's electricity rate of 46 cents per kilowatt hour) on their individual electric bills. Collectively, over the next 10 years, 300 households would save more than \$1.1 million in energy costs.

If you live on Molokai and are interested in participating in Hui UP!, visit blueplanetfoundation.org/huiup or call 560-5410.

Molokai warms up to program offering discounted fridges

October 21, 2013

By LEE IMADA - Managing Editor (leeimada@mauinews.com) , The Maui News

Sixty Molokai residents traded in their old refrigerators - some 20 years old - for new more energy-efficient ones Tuesday - for \$250.

The cost included delivery and recycling of the refrigerators in the Hui Up! 3.0 appliance exchange program offered in a partnership among the nonprofit Blue Planet Foundation; Hawaii Energy, a ratepayer-funded conservation and efficiency program; and Sust'AINable Moloka'i, a local, grass-roots sustainability group.

The Energy Star Kenmore 18.2-cubic-foot, top-freezer fridge, shipping, delivery and disposal likely would have cost more than \$1,000, but program participants received a large discount, said Catherine Lo, communications director for the Blue Planet Foundation.

Article Photos

A shipment of Energy Star refrigerators is ready for delivery to Hui Up! participants on Molokai. Sixty refrigerators were delivered to Molokai residents at a cost of \$250 apiece through the Hui Up! program.

"We're really happy the people on Molokai are so enthusiastic about the program," said Lo. "On Molokai, I guess they are a great example of how efficiency can help households lower their energy costs."

She said the 60 residents, the first of possibly 300 to receive new fridges through the program, could save as much as \$90 a month in their power bills, especially because some of the refrigerators were rusted and more than 20 years old. The older models are not very energy efficient, said Lo, which compounds the fact that Molokai residents pay the second highest electricity rates in the state at 46 cents per kilowatt hour, about 7 cents a kilowatt hour more than Maui residential ratepayers.

"Basically, our electric rate is out of the roof, and this is one way we can bring our electric bill down," said Hui Up! 3.0 participant Desiree Puhi. "Here on Molokai, we don't have the Lowe's or the Costco. Getting appliances here is so difficult, so it's a great program."

There is no store that sells new large appliances like stoves and refrigerators on Molokai, said Lo. Most residents have to take a trip to Maui or Oahu, purchase the appliance and then arrange for shipping and delivery, she said.

In order to qualify for Hui Up! 3.0, applicants have to be Molokai residents and Maui Electric Co. ratepayers. Participants are asked to show proof of a residential MECO account and an old refrigerator in working order and put up the money upfront.

The volume purchase was negotiated by Blue Planet Foundation with funding from Hawaii Energy. The shipping, delivery and hauling away of the old fridges were worked out among Sust'AINable Molokai, Sears, Makoa Trucking, Island Movers and Refrigerant Recycling.

"We're very proud to partner with Blue Planet Foundation and Sust'AINable Molokai to help aid our mission to encourage more and more people to conserve and find ways to be more efficient with their energy usage," said Ray Starling, Hawaii Energy program director, in a news release.

Hui Up! 3.0 is a follow-up to an exchange program that replaced 36,000 incandescent bulbs on Molokai with energy-saving CFLs about two years ago. "We thought we don't want to just leave the community," said Lo, so the group did energy assessments and found that refrigerators were "really costing those households a lot of money."

Sust'AINable Molokai Youth Energy Team members visited participating households to conduct an energy assessment prior to receiving the new fridges and will be revisiting families to measure their change in energy consumption, a news release about the program said.

Another shipment of about 40 refrigerators is set for delivery in early November, Lo said.

"We are hoping to do 300 before the end of the year," she said.

Molokai residents interested in Hui Up! 3.0 may find applications online at blueplanetfoundation.org/huiup or by calling (808) 560-5410. Refrigerators are ordered on a first-come, first-served basis.

Rid-A-Fridge and help the hungry

Hawaii Energy's Rid-A-Fridge to Fight Hunger promotion encourages residents to recycle old refrigerators or freezers and donate their rebates to their local food bank.

Hawaii Energy is offering this opportunity as part of its ongoing refrigerator bounty program that provides free curbside pickup, recycling and a \$65 rebate.

While funds last, residential electric ratepayers can donate their rebate to The Food Basket. A \$65 donation provides food for 250 meals on Hawaii Island.

All residential electric utility customers are eligible for the promotion. Full-size refrigerators and freezers of at least 14 cubic feet qualify for the promotion. Refrigerators and freezers must be in working condition.

Appointments to schedule a pick up can be made by calling (877) 231-8222. For more information, visit hawaiienergy.com/rid-a-fridge.

HONOLULU - Hawaii Energy's "Rid-A-Fridge to Fight Hunger" promotion encourages residents to recycle old refrigerators or freezers and donate their rebates to their local food bank.

Hawaii Energy is offering this new opportunity as part of its ongoing refrigerator bounty program that provides free curbside pickup, recycling and a \$65 rebate for Maui residents.

While funds last, residential electric rate payers on Maui can choose to donate their rebate to Maui Food Bank. A \$65 donation can provide food for 250 meals on Maui.

"Recycling an energy-wasting fridge or freezer is a very simple way to make an immediate impact on your monthly electric bill," explained Caroline Carl, Hawaii Energy's residential program manager.

"With 'Rid-A-Fridge to Fight Hunger,' customers can now enjoy the dual benefit of saving electricity while helping people that go hungry each day."

Refrigerators and freezers built prior to 1993 can be two to three times more expensive to operate than a new Energy-Star model.

Appointments to schedule pickup can be made by calling (877) 231-8222. For more information, visit www.hawaiienergy.com/rid-a-fridge.

Holiday energy-saving tips

December 30th, 2013

By Nina Wu

<http://thegreenleaf.staradvertiserblogs.com/2013/12/30/holiday-energy-saving-tips/>

It's been a sunny holiday season in Honolulu, so rejoice if you have solar panels. If you don't, then put it on your New Year's resolution list because it's not too late — many solar contractors are offering informational sessions to help you navigate the new rules for solar PV installation.

Federal and state tax credits are still available, so there's no reason to delay.

Meanwhile, here are some holiday energy-saving tips from [Hawaii Energy](#).

CHRISTMAS TREE LIGHTS

Use **ENERGY STAR LED light strings**, which use about 70 to 80 percent less energy than traditional incandescent strings. (I was surprised to see some ads for incandescent holiday lights out there). Even if they are on sale, consider the energy savings you will reap from LED lights — which can also be found at a good price. I bet they're on sale now that Christmas is over.

Limit the Time of Outdoor Lights

Use a timer to automatically turn off indoor or outdoor Christmas lighting displays.

COOKING IN THE OVEN

Keep Oven Doors Closed

Ovens lose about 25 degrees requiring additional energy to bring the temperature back up. Use the smallest pan and burner needed for the job. Cook with lids on your pans (cooking pasta without a lid can use three times as much energy).

FRIDGE & FREEZER

Keep the refrigerator door closed, too. Refrigerators get a real workout during the holidays and remains the second largest energy consumer in your home. Keep the doors closed as much as possible and try not to cram too much food at once (tough when you have a turkey in there).

WASHING CLOTHES

Only wash full loads, use cold water (which requires less energy) and air dry as much as possible.

Hawaii Energy reports let residents compare electricity usage to neighbors

[Duane Shimogawa](#)

Hawaii Energy is sending some Oahu residents free reports in the mail that compare their electricity usage to their neighbors in an effort to encourage energy efficiency, the ratepayer-funded energy conservation and efficiency program said Wednesday.

The reports, which 57,500 residents will begin receiving this month, are designed to provide electricity usage information, offer customized energy-saving tips and track month-to-month progress.

Each household's energy usage is compared with 100 anonymous homes nearby that are similar in age, square footage and number of bedrooms.

"This is a very unique opportunity for people to see how their electricity habits stack up with their neighbors which can be a great motivator for positive change," Hawaii Energy Program Director [Ray Starling](#) said in a statement. "From years past, the reports proved to be very helpful to raise awareness about the importance of energy efficiency and how it can really save money."

The reports will be followed by three additional monthly reports to illustrate each household's progress towards saving electricity.

Originally launched in the Ewa Plain area on Oahu in 2011, followed by the other islands the next year, the Home Energy Report pilot program has saved an estimated 7.54 million kilowatt hours and \$2.94 million toward electricity bills in some 75,000 households.

Hawaii Energy doubles rebate for old refrigerators

Hawaii Energy, a ratepayer-funded energy conservation and efficiency program, said Wednesday that it is doubling its rebate to \$50 for recycling extra working refrigerators or freezers on Oahu.

The higher rebate is designed to encourage residents to give up their energy-hogging, extra refrigerator or freezer, and in exchange, Hawaii Energy is providing free curb-side pick-up of the recycled appliances.

Refrigerators and freezers built before 1993 can be two to three times more expensive to operate than a new Energy Star model, so taking those old units off the electric grid could save Oahu residents as much as \$275 on their electric bills each year, Hawaii Energy said.

Rather than accept the rebate, residents also have the option of donating their old refrigerators to the [Hawaii Foodbank](#) by filling out the application provided by the hauler at the time of the pick-up to donate it to the "Rid-A-Fridge to Fight Hunger" promotion.

A \$50 donation could provide food for 125 meals on Oahu to those in need.

To date, about 1,792 refrigerators and freezers have been recycled, saving more than 1.5 million kilowatt hours of electricity and more than \$550,000 in electricity costs.

For more information, go to www.hawaiienergy.com/bounty.

Double rates for rid-a-fridge

January 22nd, 2014
By Nina Wu

Still procrastinating on plans to get rid of your old fridge?

Hawaii Energy is giving you some motivation — it is now offering \$50, double the \$25 rebate originally offered for outdated, energy-hogging refrigerators and freezers.

Free curbside pick-up is available.

According to Hawaii Energy, **fridges and freezers built prior to 1993 are energy hogs that cost two to three times more to operate** than a new **EnergyStar** model. Taking those old units off the electric grid can save Oahu resident as much as \$275 (based on current electricity rates) on the annual bill.

Residents can also donate the rebate to **Hawaii Foodbank** by simply checking a box on the application provided by the hauler at the time of refrigerator pick-up.

All Oahu residential electric utility customers are eligible. To qualify, fridges and freezers must be full-size and in working condition. Since Hawaii Energy launched its "Bounty Program" in August 2011, approximately 1,792 refrigerators and freezers have been recycled, keeping them out of landfills.

Hawaii Energy Savings Reports

A simple but effective strategy to motivate residents to keep electric bills low.

January 24, 2014

As [South Maui real estate specialists](#), we like to keep an eye out for innovations that improve the lives of homeowners anywhere in Hawaii, and on that note, an interesting story came out recently about saving on electric bills. Hawaii Energy has begun sending Oahu residents free reports that compare their electricity usage to their neighbors in order to encourage energy efficiency, and it seems to be working. What a simple, smart idea.

This month, 57,500 residents will begin receiving the report, which will provide electricity usage information, offer customized energy-saving tips, and track the resident's month-to-month progress. There's nothing like a little competition to get people engaged in outperforming their neighbors, especially when it clarifies how much more money you are spending by using excess energy.

How the report works is that it provides information on 100 anonymous houses nearby, particularly the ones that are similar in age, square footage, and number of bedrooms. To make accurate comparisons, they need to look at [Hawaii homes](#) that are as similar as possible.

Ray Starling, the Hawaii Energy Program Director, said in a statement, "This is a very unique opportunity for people to see how their electricity habits stack up with their neighbors, which can be a great motivator for positive change."

After these homeowners get their initial report, they will get three follow-ups that will show them their progress, so they'll have some concrete evidence that their energy-saving efforts are adding up to real savings. So far, it's estimated that the Home Energy Report pilot program has saved about 7.54 million kilowatt hours and \$2.94 million in electric bills throughout 75,000 households.

Let's hope that simple but effective strategies like these continue to make Hawaii an affordable, enjoyable and healthy place to live. Mahalo for reading this week!

Pacific Beach Hotel gets largest energy incentive check of any Hawaii hotel

The Pacific Beach Hotel received an incentive check for \$308,145 this week from Hawaii Energy for the energy upgrades made to the 839-room hotel in Waikiki.

The [Pacific Beach Hotel](#) in Waikiki has received the largest incentive check by a hotel as part of [Hawaii Energy](#)'s initiative to make commercial properties more energy efficient, the ratepayer-funded conservation and efficiency program said Thursday.

The 839-room hotel, located at 2490 Kalakaua Avenue, which features the popular three-story indoor Oceanarium, received its \$308,145 incentive check this week.

Recent upgrades to the hotel's air conditioning system, as well as the installation of a new energy management system, will save the hotel about \$280,000 per year in electricity costs.

The Pacific Beach Hotel invested more than \$2.1 million into the project, which included installing a new central air conditioning system, which was done by Honolulu-based [Energy Management Consulting & Construction LLC](#) over the period of a little more than a year.

The hotel also was the 2013 recipient of the [Waikiki Improvement Association's](#) Hoowehiwehi Award for its eco-friendly guest water bottle program, in which it provided each guest with a reusable water bottle upon check-in that can be refilled at various stations throughout the property.

The program eliminates an estimated 350,000 bottles per year from ending up in a landfill.

Resort Receives 'Grand' Energy Incentive

INCENTIVE IN PARADISE -From left, Bart Santiago, Director of Finance, Grand Wailea; Rob Hoonan, Director of Facility Management, Grand Wailea; Walter Enomoto, Program Specialist at Hawaii Energy. Click to enlarge. (Photo Courtesy Hawaii Energy)

Hawaii Energy, the energy conservation and efficiency program for Maui, Hawaii and Honolulu counties, presented an incentive check for \$202,048 to the award-winning Grand Wailea, a Waldorf Astoria Resort, for its commitment to become even *more* energy-efficient.

Grand Wailea recently installed 37 new variable frequency drives and pump equipment designed to seamlessly adjust the water flow for its Wailea Canyon Activity Pool that includes nine separate pools and various waterslides, white water rapids, whirlpool and the world's first "water elevator."

The new equipment requires less electricity to operate and is estimated to save the hotel more than 1.2 million kilowatt hours and more than \$380,028 in annual electricity costs based on \$0.309/kWh.

To learn more about energy efficiency incentives available for your home or business, visit www.hawaiienergy.com.

Hawaii Energy is a ratepayer-funded conservation and efficiency program administered by Leidos Engineering, LLC, under contract with the Hawaii Public Utilities Commission, serving the islands of

Hawaii, Lanai, Maui, Molokai and Oahu. Hawaii Energy offers cash rebates and other incentives to residents and businesses to help offset the cost of installing energy-efficient equipment. In addition to rebates, the program conducts education and training for residents, businesses and trade allies to encourage the adoption of energy conservation behaviors and efficiency measures. The program plays an important role in helping to achieve Hawaii's goal of reducing total electric energy usage by 30 percent or 4.3 billion kWh by 2030. For more information, visit www.HawaiiEnergy.com.

Grand Wailea is nestled on 40 acres of lush tropical gardens fronting Wailea Beach, providing open spaces for the active vacationer, beauty for the romantic getaways and fun for the whole family. Built to portray the richness of Hawaii's culture, people, and nature, Grand Wailea is the ultimate Hawaiian resort providing an extensive selection of amenities and activities. Since opening in 1991, Grand Wailea consistently ranks among the world's best resorts by leading travel consumer reports and industry peers. For more information, call 800.232.4604 or visit www.grandwailea.com

Time To Stay Cool

Saving energy on your water cooler is all about timing.

By Keith Block

Water coolers are commonplace in homes and just about every office in America. Hawaii is no exception. In fact, there are more than 25,000 businesses in Hawaii that have water coolers.

Office workers commiserate around the water cooler on a Monday morning, warm their salsin for lunch and escape the summer heat with a refreshing glass of water. However, something we never give much thought to is how much electricity a water cooler uses, and how much it costs us?

For starters, water coolers in the U.S. consume about 7 billion kilowatt hours (kwh) annually—enough electricity to power a stadium's lighting for roughly 350,000 football games.

Most water coolers constantly draw electricity 24 hours a day, seven days a week, even if we only use them

for a fraction of the day and rarely if ever on the weekends. Depending on the make, model and usage, a single water cooler with both cold and hot water spigots can draw up to 700 kWh annually—more than a full-size refrigerator (14 cubic feet). In terms of electricity costs, that equates to an estimated \$217 on Oahu and slightly more on the Neighbor Islands.

However, the solution is very simple and not to mention free. Hawaii Energy, the ratepayer-funded energy conservation and efficiency program serving Hawaii, Honolulu and Maui counties, recently launched a new upstream water cooler timer program.

Now until June 30, 2014, or while supplies last, businesses in Hawaii will be able to obtain free plug-in water cooler timers with a retail value of about \$30 each. In order to qualify, businesses must be located

on either Hawaii Island, Lanai, Maui, Molokai or Oahu and be on one of the following electric rate schedules: P, J or G.

"Our goal is to encourage simple, yet practical measures such as installing a timer to help more businesses in Hawaii achieve instant savings on their electric bills," explains Keith Block, business program manager at Hawaii Energy. "This is just one of many simple energy-saving measures. We want to make more people aware that small, every day behavioral changes can mean big cost and energy savings in the future."

Water cooler timers operate the same way as home timers that are used to turn lights on and off at specified times. Customers simply plug the timer into the electrical wall outlet. The water cooler plug is then inserted directly into the timer.

A sample of an easy-to-use water cooler timer, which can save you more than \$100 per year per water cooler. Courtesy of www.hookeleneews.com.

Customers can pre-program the timer to turn the water cooler on an hour prior to the office opening and off in the late evening.

The water cooler timers provided by Hawaii Energy are distributed through participating vendors. The timers are all digital, include an internal rechargeable battery and 7-day programmable on/off settings.

On average, a water cooler timer can reduce electricity usage by an estimated 60 percent (about 397 kilowatt hour kWh) per year. That translates to a savings of \$123 on electricity per water cooler annually, based on \$0.31/kWh (on Oahu).

BMH Resource

To obtain a free water cooler timer, visit www.HawaiiEnergy.com/timer or call toll-free at 1-877-231-8222. Ask about other cash rebates and incentives for your business.

Keith Block is the business program manager at Hawaii Energy and has more than 20 years of experience working in energy conservation. His team implements energy conservation programs to help businesses reduce their electric bills. Hawaii Energy is the ratepayer-funded conservation and efficiency program administered by Leides Engineering, LLC, under contract with the Hawaii Public Utilities Commission (PUC).

Water coolers in the U.S. consume about 7 billion kilowatt hours (kwh) annually—enough electricity to power a stadium's lighting for roughly 350,000 football games.

\$150 rebate offered toward cost of solar water heater tune-up

By Star-Advertiser Staff

Hawaii Energy is offering a \$150 rebate for homeowners to help offset the cost of doing maintenance on their solar water heaters.

The rebate is available for maintenance done between Feb. 1 and May 31, or until funding runs out, according to a news release from Hawaii Energy, the ratepayer-funded energy efficiency program for Honolulu, Maui and Hawaii counties.

Solar water heaters require maintenance every three to five years to check for wear and tear that may include leaks, corrosion or pump failure, according to the news release. A properly maintained solar water heater should last 15 years or more.

In order to qualify for the rebate, systems must be at least three years old and the tune-up must be performed by a Hawaii Energy participating contractor. The cost of a tune-up typically ranges between \$300 and \$500, according to Hawaii Energy.

For more information, go to www.hawaiienergy.com/tune-up or call (808) 537-5577 or toll-free (877) 231-8222.

Pacific Beach Hotel Earns \$308K for Energy Program

Tuesday February 18th, 2014 - 10:13AM

HONOLULU, HI—Pacific Beach Hotel received a \$308,145 incentive check from Hawaii Energy for the hotel's commitment to becoming more energy efficient.

The incentive is the largest amount presented to a hotel by Hawaii Energy—the ratepayer-funded conservation and efficiency program serving Hawaii Island, Lanai, Maui, Molokai and Oahu.

Recent upgrades to the hotel's air conditioning system, as well as the installation of a new energy management system, will save the Pacific Beach Hotel more than 1 million kilowatt hours (kWh) annually or \$280,000 per year in electricity costs, according to the company. The Pacific Beach Hotel invested more than \$2.1 million into the project.

The hotel's new central air conditioning system was installed for the hotel, which encompasses the Beach Tower and the Oceanarium Tower. The project involved replacing an older air conditioning system with newer energy-efficient equipment including chillers, chilled water pumps and water condenser pumps. The energy management system centralizes the operation. These projects were handled by Energy Management Consulting & Construction, LLC, and took place over the past 18 months.

"We are delighted to have partnered with Hawaii Energy and look forward to celebrating this achievement with our valued Pacific Beach associates," stated Rob Robinson, general manager, Pacific Beach Hotel. "Our hotel is committed to energy conservation and will continue to research additional ways to become even more efficient."

Pacific Beach Hotel also was the 2013 recipient of the Waikiki Improvement Association's Hoowehiwehi Award for its eco-friendly guest water bottle program. The hotel provides each guest with a reusable water bottle upon check-in that can be refilled at various stations located throughout the hotel. The program eliminates an estimated 350,000 bottles per year from ending up in a landfill, according to the company.

"Pacific Beach Hotel is a terrific example of an organization recognizing the importance of investing in energy efficiency," stated Ray Starling, program director, Hawaii Energy. "We look forward to working with their team in the future to identify other projects to maximize their energy savings."

Free Energy Education Workshops for Teachers

Wednesday, February 19th, 2014

By Molokai Dispatch Staff

Hawaii Energy News Release

This spring, Hawaii Energy is offering free, one-day workshops with tools and resources for Hawaii's teachers to learn about and teach energy efficiency in the classroom. The Molokai workshop will be held on March 1 at Molokai High School from 8:30 a.m. to 3:30 p.m.

Teachers of all subjects from Kindergarten –through 12th grade are welcome to attend. There are two types of workshops. One is Energy Education that teaches the concepts of force, motion, light, sound, heat, electricity, magnetism and energy transformations. The other is Building Science, aimed at helping students learn how buildings can become more energy-efficient through various measures such as lighting inspections, measuring electricity plug loads and taking temperature readings.

Each teacher will receive training, a choice of energy kits (valued between \$300 and \$400), breakfast, lunch, curriculum and access to online materials and resources. Reimbursement for substitute teachers will be provided. Participants are eligible to apply for Hawaii Energy Education Grants up to \$2,500 and a scholarship to attend NEED's annual National Energy Conference for Educators.

The workshops are taught by The NEED (National Energy Education Development) Project in collaboration with Hawaii Energy – the ratepayer-funded energy conservation and efficiency program for Hawaii, Honolulu and Maui counties.

Space is limited. Register online at least 7 days prior at HawaiiEnergy.com/teacher-workshops. Contact Wendi Moss with questions at wmoss@need.org or call 1-800-875-5029.

Energy Education with Big Goals

Friday, March 14th, 2014

By Catherine Cluett

Molokai High junior Sarah Jenkins hopes that her senior project will take an island-wide trend of energy awareness and conservation to the next level. She said she thinks teaching Molokai's youth about energy literacy is a good place to start, and on March 1, teachers from around the island participated in an energy education workshop with that very goal.

In a series of workshops offered statewide in collaboration between Hawaii Energy, a ratepayer-funded energy conservation and efficiency program, and National Energy Education Development (NEED), nearly 20 Molokai teachers from elementary through high school levels learned how to better

educate their students on energy topics. In addition to performing a number of hands on activities for themselves, they each went home with a kit valued at \$300 to \$400 to use in their classrooms.

"This workshop sparks the interest of teachers to teach kids [about energy] at a young age — something I never had," Sarah said.

Kim Moats-Barnes, NEED program associate, led the workshop, offering an overview of energy facts, electricity consumption numbers and hands-on learning activities geared toward understanding the science of energy.

In Hawaii alone, for example, 33 barrels of oil are used for each man, woman and child living in the state. Seventy-four percent of energy generated comes from imported oil. Hawaii Energy claims to be helping to change those numbers and push the state toward its goal of 70 percent clean energy by 2030.

Molokai Dispatch

Feb. 19, 2014

(Page 2 of 3)

"If [students] can go home and show their parents how energy efficiency works, hopefully [we can reduce fossil fuel consumption]," said Moats-Barnes. "Because Molokai is so small, everybody's actions account for a larger percentage."

Teachers gathered around experiments from the kits using batteries, wires, thermometers, light bulbs and even apples to show the science of energy.

"It's going to give me different ways to demonstrate [energy]," said MHS teacher Weldon Wichman. He said he already teaches a unit on energy but said the kits will expand the opportunities to present the material.

Jonathan Smith, an MHS math teacher and one of Jenkins' senior project advisors, agreed.

"The earlier students are exposed to [energy education], they'll live the lifestyle [of energy conservation]," he said, supporting Jenkins' hope that one day, the entire island will be more conscious of their energy footprint.

For the high school's immediate future, Smith said energy conservation could have a tangible and much-needed effect.

"Spend less money on electricity, and that would secure more money for teachers," he said, adding that by reorganizing and prioritizing schools' limited funding could mean more resources could be directed where they're most needed — on teaching students.

When Sarah and her mother, Canoe Complex Area STEM Resource Teacher Heidi Jenkins, learned the workshop was coming to Molokai, they helped "spark the interest of teachers to come," said Sarah.

The workshop is part of the junior's senior project action plan. She's getting a head start on the project by launching a two-week energy challenge on campus next month, as well as conducting an energy audit on the school. In addition, Sarah plans to visit both elementary and high school classrooms to help teach energy literacy.

Next year, she'll be working with Hawaii Energy and NEED to make adjustments to how the school uses energy.

"Once I've identified the major users of electricity [where most of MHS's electric bill is spent], then we'll work to improve the school by implementing those changes," said

Molokai Dispatch

Feb. 19, 2014

(Page 3 of 3)

Sarah. She said she's also working on a green management plan for the proposed new science classroom building on campus.

That will be made possible in part by a \$2,500 grant from Hawaii Energy and NEED that Sarah wrote with Smith.

Sarah's interest in energy was sparked by working with two energy-saving initiatives that took place across Molokai as a partnership between Blue Planet Foundation and Sustainable Molokai. Over the past few years, the CFL light bulb exchange and the Hui Up program that offered trades for old refrigerators with Energy Star models have already raised residents' awareness of electricity conservation, Sarah said.

The CFL and fridge exchanges already taught residents about energy efficiency, or using technology to eliminate waste and still get the desired services without using as much electricity. But Sarah's project hopes to take efficiency to the next level: conservation.

"Conservation is actually changing behaviors and habits to use less energy," she explained. For example, using an electric car would decrease the use of gas, but adjusting one's lifestyle and riding a bicycle instead of driving a car would conserve the most resources.

Saturday's event was one step in that process.

"After the teachers obtain this new knowledge, my goal is to utilize teachers and students to help improve energy conservation at Molokai High School and throughout the island," said Sarah.

Aloha Petroleum receives incentive check from Hawaii Energy

From left, Jimmy Pastor of Aloha Petroleum, Lily Koo of Hawaii Energy and Jeff Finch of Aloha Petroleum pose with the company's incentive check.

[Aloha Petroleum](#) Ltd., the largest independent gasoline marketer and one of the biggest convenience store operators in Hawaii, received a \$41,352 incentive check from Hawaii Energy for installing energy-efficient lighting at 17 of its gas stations on Oahu.

Hawaii Energy, the ratepayer-funded energy conservation and efficiency program from all counties in the state except Kauai, said the check will help offset the cost of replacing old, inefficient lighting fixtures with 175 new, more efficient LED lighting fixtures. Aloha Petroleum said it will save an estimated \$88,920 a year on its electricity bill.

The Honolulu-based company also is working with Hawaii Energy to retrofit its refrigerator and freezer case lighting with LEDs at various Aloha Island Marts across Oahu.

Just recently, Aloha Petroleum installed solar photovoltaic systems at five Aloha Island Marts on Oahu and one on the Big Island, which helped reduce its electric bill by up to 45 percent depending on the store's location with additional PV projects being considered.

Green Magazine (Website)

Feb. 27, 2014

<http://greenmagazinehawaii.com/hawaii-energy-presents-check-to-aloha-petroleum/>

Hawaii Energy Presents Check to Aloha Petroleum

Hawaii Energy, the ratepayer-funded energy conservation and efficiency program for Hawai'i, Honolulu and Maui counties, presented a check to Aloha Petroleum for installing energy-efficient LED lighting at 17 gas stations on O'ahu. The \$41,352 incentive check will help offset the cost for replacing old, inefficient metal halide lighting fixtures with 175 new, more efficient LED canopy lighting fixtures. The new lights provide a warmer ambience and help increase visibility while customers pump their gas.

Aloha Petroleum will save an estimated 292,437 kilowatt hours (kWh) annually; equivalent to saving about \$88,920 toward their electricity costs based on \$0.28/kWh and \$11.69 per kilowatt (kW) per month. The company is also working with Hawaii Energy to retrofit its refrigerator and freezer case lighting with LEDs at various Aloha Island Marts across O'ahu.

Recently, the company installed photovoltaic solar panels at five Aloha Island Marts on O'ahu and one on the Big Island that helped reduce its electric bill by 20 to 45 percent depending on the store's location. Additional photovoltaic projects are also being considered. Aloha Petroleum was also the first petroleum company in Hawai'i to install electric vehicle chargers at three of its retail fuel locations.

USA: Aloha Petroleum Gets Incentives for Energy Efficiency

Thursday, 06 March 2014

Aloha Petroleum has announced receipt of \$41,352 from Hawaii Energy, a local energy conservation and efficiency programme, for installing energy-efficient LED lighting at 17 fuel service stations.

The incentive helps meet the cost of replacing old, inefficient metal halide lighting fixtures with 175 new, more efficient LED canopy lighting fixtures. Aloha Petroleum will also save an estimated 292,437 kilowatt hours annually, equivalent to saving about \$88,920 toward its electricity costs.

Aloha, which retails fuel at 100 Shell-, Aloha-, and Mahalo-branded fuel service stations throughout Hawaii, is also working with Hawaii Energy to replace its refrigerator and freezer case lighting with LEDs at various Aloha Island Marts across Oahu. Separately, the company recently installed photovoltaic (PV) solar panels at five Aloha Island Marts on Oahu and one on the Big Island, helping to reduce electricity bills by between 20% and 45%.

Teaching Keiki to Save Energy

Saving Energy is Easy, Inexpensive and Educational for the Entire Family

We've all reminded our kids to "turn it off if you're not using it!" And for good reason, right? Nearly everything in our home requires electricity from lights, appliances, electronics to hot water and air conditioning.

Hawaii Energy, the energy efficiency and conservation program serving the islands of Maui, Hawaii, Lana'i, Molokai and Oahu, offers some easy (and free) tips to follow.

Lights Out – As we touched upon earlier... if they're the last one to leave the room, make sure they turn the lights off either at home or school.

Turn Off & Unplug – Turn off and unplug stereos, TVs, DVD players, clocks and battery chargers. Any device with a light continuously draws power, called a "phantom load", even when turned off. Connect these devices to an advanced power strip to make turning it off all at once easier. You can save about \$10 per year.

Shut It – Refrigerators are the second largest consumers of energy (after water heating) accounting for about 15 percent of your electricity usage. Keeping the door open too long can cost between \$17 to \$23 a year.

Game Over – Always have them check to see if their video game consoles and computers are off and not on sleep-mode. They are very easy to overlook and draw a lot of power.

Shorten It at Shower – Shortening your shower by just two minutes every day could save about \$56 per year. Not to mention you'll also save on your water bill!

Hang It Up – Let your children burn off extra calories and save electricity by hand-drying dishes rather than relying on the dishwasher's heated dryer. It can save about \$23 per year.

Fan Favorite – Have them cool off with fans instead of running the air conditioner. If they do use the air conditioner, use fans to circulate the cold air.

The sooner children learn the importance of saving energy the better. Better for your pocketbook too.

Want to learn more? Hawaii Energy offers cash rebates and other incentives to residents and businesses to help offset the cost of installing energy-efficient equipment. Visit www.HawaiiEnergy.com or call toll-free at (877) 231-8222.

ENERGY

Businesses can get free upgrades to save energy

Small businesses and restaurants on Oahu, the Big Island, Maui, Molokai and Lanai are being encouraged to take advantage of an opportunity to replace for free their old lighting with newer energy-efficient fixtures and bulbs between now and June.

The program is being overseen by Hawaii Energy, a ratepayer-funded energy conservation and efficiency program for all the major islands except Kauai.

Since Hawaii Energy's Small Business Direct Install Lighting program launched in 2011, a total of 1,790 small businesses and restaurants have participated, receiving free consultation, lighting and installation. They range from hardware stores to surf shops to art galleries to bakeries.

Hawaii Energy estimates that the total amount of electricity saved on lighting at 9.4 million kilowatt hours or \$310,200.

To qualify, businesses must have individual meters and be on an electric rate schedule "G," or occupy a work space of less than 5,000 square feet.

Hawaii businesses: Save energy plus LED exit signs

March 31st, 2014
By [Nina Wu](#)

Universal LED Exit sign from www.simplyexitsigns.com.

Swapping to an LED exit sign can save a business substantial electricity costs plus qualify for a \$40 rebate from Hawaii Energy.

Attention, Hawaii businesses.

Did you know swapping out your older, incandescent exit sign for an LED one can save you \$80 to \$100 a year. [Hawaii Energy](#)'s offering up to \$40 in additional incentive to businesses that do so from now until **May 31**.

An Energy Star LED exit sign uses only about 44 kilowatt hours annually compared to 350 kilowatt hours for an incandescent sign — about 87 percent in savings.

It's as simple as that.

The exit signs, a legally-required safety feature in case of an emergency, are on 24 hours a day throughout the year.

Businesses must complete an application and submit a paid invoice or show proof of purchase to qualify for the incentive.

Also, [Hawaii Energy](#) is offering small businesses and restaurants an opportunity to replace their old lighting with newer, energy-efficient ones for free from now until **June 9**. Incandescent bulbs and halogen lighting are swapped out for CFLs (compact fluorescent lamps) and LEDs (light-emitting diodes).

To qualify, businesses must have an individual meter and be on an electric rate schedule G, or occupy a workspace of less than 5,000 square feet. Restaurants on any electric rate schedule or of any size can qualify.

Pagoda took advantage of Hawaii Energy's lighting retrofit program to save costs. Courtesy photo.

Pagoda Floating Restaurant participated in the program, and expects to save about \$14,400 a year.

Visit www.hawaiienergy.com/retrofit to apply.

Lighting can account for nearly half of a retail businesses' overall electricity costs at 48 percent. For offices, it's about 27 percent, and for restaurants, about 18 percent.

March 31, 2014
(Page 3 of 3)

Hawaii Energy's Small Business Direct Install Lighting program, launched in July 2011, has helped 1,790 small businesses and restaurants throughout the state — from hardware stores to surf shops, art galleries and bakeries. The program provides free consultation, lighting and installation.

Hawaii Energy is a ratepayer-funded energy conservation and efficiency program serving the isles of Hawaii, Lanai, Maui, Molokai and Oahu.

Hawaii businesses can turn their old exit signs into cash

Pacific Business News

Mar 31, 2014, 12:33pm HST

Replacing an old exit sign with a more energy efficient model could save a business up to \$100 a year in electricity costs.

Hawaii businesses can turn their old lighted exit signs into cash by replacing them with new, more efficient signs that could save up to \$100 per year on electricity costs.

Hawaii Energy, the ratepayer-funded energy conservation and efficiency program for the Big Island, Lanai, Maui, Molokai and Oahu, also is offering a \$40 incentive with a new light-emitting diode, or LED, exit sign from now until May 31.

"We encourage all businesses to update their exit signs to ensure the safety of their tenants and to help lower overhead costs," Hawaii Energy Business Program Manager [Keith Block](#) said in a statement. "It's a simple energy-efficient measure that any business with an existing sign can take advantage of."

Exit signs are an important and legally-required safety feature in case of an emergency, and these signs consume large amounts of energy from operating 24 hours per day throughout the year, Hawaii Energy said.

To find out more about this program, go here: www.hawaiienergy.com/lighting.

The Honolulu-Star Advertiser

March 31, 2014

Business Briefs

For Tuesday, April 1, 2014

By Star-Advertiser staff

Rebates offered for switch to LED exit signs

Businesses in Oahu, Maui and Hawaii counties are eligible to receive a rebate of \$40 for each incandescent "exit" sign they replace with one that is illuminated with a light-emitting diode, or LED.

The rebates are being offered by Hawaii Energy, the ratepayer-funded energy conservation and efficiency program that operates in the three counties. The offer is available through May 31.

LED exit signs certified by the Energy Star program use about 44 kilowatt-hours of electricity a year compared with 350 kilowatt-hours a year for an incandescent sign — a savings of 87 percent, according to a news release from Hawaii Energy. For each incandescent exit sign replaced, the savings is about \$80 to \$100 a year, according to Hawaii Energy.

“Sub-stantial” Cost and Electricity Savings with Submetering

by Hawaii Energy

Everyone from residents to businesses consume electricity differently. Some of us have large families at home or operate machinery or equipment at work that simply requires more electricity. Others may use very little electricity because of frequent business trips and are away from home for weeks at a time. The reasons can be plentiful. So it only makes sense to pay for the electricity you use rather than everyone paying the exact amount.

Condominiums and their Association of Apartment Owners (AOAO) are often on a single electrical “master meter” that monitors electricity for the entire building. The building’s management purchases the electricity at a bulk rate and bills each resident. Electricity payments are a fixed amount based on a percentage of ownership within the property or the number of total units. The downside as mentioned earlier is that you’re not paying for actual usage.

Installing a submetering system can drastically minimize these scenarios. It encourages tenants to become financially-responsible for their consumption behavior and it allows for a fair distribution of electricity costs. The building’s management can also continue to pay a lower bulk rate for electricity.

The cost to install an electrical submetering system may range from \$350 - \$550 per unit. Monthly service fees can add an additional \$1.50 to \$5.

Hawaii Energy – the ratepayer-funded energy conservation and efficiency program for Hawaii, Honolulu and Maui counties – offers a means to offset these costs with a substantial incentive of \$150 per unit (up to 50 percent of the total project cost) for submeters used for billing. The program also provides education and an energy audit for equipment such as common area lighting, HVAC and central air conditioning or domestic water heating to help submetering participants.

Hawaii Energy is administered by Leidos Engineering, LLC, and is under contract with the Hawaii Public Utilities Commission. The program was designed to help both residents and businesses save money on their electric bills and reduce our state’s dependence on imported oil.

continued on page 7

Submetering, from page 1

Submetering goes beyond allocating the cost of electricity. It’s a motivator to conserve energy. Depending on the property and occupant’s willingness to change their behavior, electricity reduction can range from 10 to 25 percent.

In turn, these energy-saving efforts help the state with the Hawaii Clean Energy Initiative to reach its 70% clean energy goal by 2030. Condominiums, strip malls and office build-

ings with multiple tenants, that are electric utility customers on Hawaii Island, Lanai, Maui, Molokai or Oahu, are eligible for the submetering incentive. Applications can be submitted until June 30, 2014, or until funding lasts.

For additional information or to download a Submetering Incentive Application & Worksheet, please visit www.hawaiienergy.com/submetering. Or contact Lisa Harmon, Business Program Specialist at Hawaii Energy, at (808) 839-8865 or lisa.m.harmon@leidos.com.

Success Story: Craigside Condos, AOAO

Just months after installation, Craigside in Nuuanu achieved significant energy reduction. In March 2012, submetering was installed for 242 units. From March to September, actual usage was down from its predicted usage by about 20 percent. This is approximately 1,000 kWh reduction per day, which is equal to about \$9,120 in electricity costs savings per month, based on 30 cents per kWh and adjusted for weather-related changes.

Hawaii Energy Offers \$150 Incentives Per Unit for Submeters

News Brief – Hawaii Energy's LED Exit Sign Rebate

Apr. 2, 2014

West Hawaii Today

West Hawaii Today

"In Brief | Island Inc." Section

April 7, 2014

Incentive offered for installing LED signs

Hawaii Energy, a ratepayer-funded energy conservation and efficiency program, is helping businesses show their old exit signs the door with a limited-time \$40 incentive.

Until May 31, businesses can qualify for the incentive when replacing an older incandescent exit sign with a new, light-emitting diode, or LED, exit sign.

An Energy Star LED exit sign uses about 44 kilowatt hours of electricity annually compared to kilowatt hours for an incandescent sign, a savings of approximately \$80 to \$100 per year.

To qualify for the incentive, businesses are required to complete an application and submit a paid invoice to show proof of purchase. For more information, visit hawaiienergy.com/lighting or call 877-231-8222.

Program replaces inefficient lighting for small businesses

Hawaii Energy, a ratepayer-funded energy conservation and efficiency program, is offering small businesses and restaurants an opportunity to replace their old lighting with newer energy-efficient lighting for free now until June 9.

Hawaii is the most oil dependent state in America and has the highest energy prices. Lighting can account for nearly half of a retail business' overall electricity costs.

Since Hawaii Energy's Small Business Direct Install Lighting program launched in July 2011, 1,790 Hawaii small businesses and restaurants have participated in the program that provides free consultation, lighting and installation.

During an installation, old incandescent bulbs and halogen lighting are removed and replaced with new, lower wattage compact fluorescent lamps, or CFLs, and light-emitting diodes, or LEDs.

In order to qualify, businesses must have an individual meter and be on an electric rate schedule G, or occupy a work space of less than 5,000 square feet. Restaurants on any electric rate schedule or of any size can qualify.

For more information or to apply, visit hawaiienergy.com/retrofit or call 877-231-8222.

Free water cooler timers offered for most Hawaii businesses

By Star-Advertiser Staff

POSTED: 10:18 a.m. HST, Apr 08, 2014

Businesses in Oahu, Maui and Hawaii counties are eligible to receive a free water cooler timers that can save more than \$100 in electricity costs annually per unit based on today's rates.

The timers are being offered by Hawaii Energy, the ratepayer-funded energy conservation and efficiency program that operates in the three counties. The offer is available through June 30.

Hawaii Energy officials estimate a typical office cooler uses \$217 worth of electricity annually on Oahu and slightly more on the neighbor islands. A water cooler timer can save about \$123 in power costs annually based on a power rate of 31 cents a kilowatt hour, according to Hawaii Energy.

The timers are available from participating vendors while supplies last. For more information go to www.hawaiienergy.com/timer, or call 839-8800 and (877) 231-8222 on the neighbor islands.

Hawaii Energy offering free water cooler timers to businesses

Apr 9, 2014, 12:02pm HST

Courtesy Hawaii Energy

Hawaii Energy says a water cooler timer like the one pictured here can save a business up to 60 percent the electricity cost to operate a water cooler.

Hawaii Energy is giving businesses another way to save money on electricity by offering a free water cooler timer.

Water coolers require electricity around the clock, but are rarely used on weekends by most businesses, and a single water cooler with hot and cold spigots can draw up to 700 kilowatt hours per year, which is more than some full-size refrigerators, the company said.

That can cost about \$217 a year on Oahu and even more on the Neighbor Islands, but a timer can cut the costs by about 60 percent, Hawaii Energy said.

Businesses on Oahu, the Big Island, Lanai, Maui or Molokai can qualify for the free timer, retail value \$30, between now and June 30, if they are on rate schedules P, J or G.

Applications are available [on the Hawaii Energy website](#).

ENERGY QUARTERLY

SOLAR HEATING

This industry's in hot water — that's a good thing

BY DUANE SHIMOGAWA
dshimogawa@bizjournals.com
808-955-8036, @PBNDuane

Rolf Christ, who has been in the solar hot water business in Hawaii for more than three decades, is noticing a resurgence in the industry as solar photovoltaic slows due to new rules instituted last year by Hawaiian Electric Co.

Sometimes called the stepsister to the solar photovoltaic industry, the solar hot water sector has been steady as ever, even picking up a bump in sales, said Christ, president of Honolulu-based R&R Solar Supply.

"One thing that has happened ever since HECO slowed down the PV market is that a lot of salespeople that used to sell PV systems are back to selling hot water systems," he said. "They can make a sale/commission quicker than selling PV systems. A lot of salespeople who sell both have gone back to selling hot water."

Last September, HECO changed its procedures related to interconnecting systems, which it said was

TINA YUEN

R&R Solar Supply owner Rolf Christ looks on as James Kekoa welds the waterways for a solar collector. Christ says many salespersons have returned to selling solar hot water systems.

necessary to ensure the safety and reliability of distributed solar, more commonly known as rooftop solar, as it entered the grid.

Christ said he has seen sales for hot

water systems at his own business rise about 20 percent year over year.

Some PV firms have been either laying off workers or doing business differently since last Septem-

ber, when HECO changed the way it allows solar energy to connect to the electrical grid. But in March,

CONTINUED ON PAGE 23

CONTINUED FROM PAGE 22

the Honolulu-based utility sent out new rules to PV contractors that increased circuit penetration levels, which has the potential to speed up the industry.

Christ, whose business also does PV work, did not lay off anyone and made up for the lost time by allowing employees to work overtime when handling solar hot water system sales.

"Hot water is long established and the penetration is very high," he said. "We have over 80,000 systems installed in Hawaii, and that's a fairly high penetration of owner-occupied houses."

Christ says the benefits of a solar hot water system compared to PV is that it's a much faster payback and it's also not as controversial as PV.

Ted Peck, former administrator of the state Energy Office and now an energy industry consultant, says that for solar hot water, there's no battle with the utility.

"To the consumer, it's a bigger payback and quicker," he told PBN. "It's a two- to three-year payback."

Peck, who has both a solar hot water and PV system on his rooftop, has saved roughly \$80 a month on his utility bill from just the solar hot water system.

"It just makes good financial

Ted
Peck

sense, and it takes no interconnection," he said.

H a w a i i Energy, the rate-payer-funded conservation and efficiency program for Oahu, the Big Island, Maui,

Molokai and Lanai, has been noticing a steady interest in solar hot water heating, especially with strong incentives and mandates such as the requirement that new single-family homes have solar hot water heating systems.

In addition to offering a \$1,000 rebate, Hawaii Energy has set up a tune-up and maintenance program.

"There seems to be a real strong focus on not just the installation but the maintenance is being recognized as an essential component," Hawaii Energy Residential Program Manager Caroline Carl told PBN.

On top of the strong interest in maintaining these systems, the number of participating contractors, which currently sits at about 80, is increasing every year.

"There is still a strong culture and interest in solar hot water heating," Carl said.

Energy reports evaluate households' usage, savings

By June Watanabe

Question: I receive mail every month from Hawaii Energy telling me how much electricity I use compared with my neighbors. I'm bothered that they have access to my records. Is that information obtained legally? They must receive this data from Hawaiian Electric. Who is Hawaii Energy, and who are they to tell me how I rank? Are they aware of how many people live in my house? Are they aware that I have applied for solar installation but permission was held up by Hawaiian Electric?

Answer: Hawaii Energy obtains its information from Hawaiian Electric Co., Maui Electric and Hawaii Electric Light and says no personal information is disclosed to other customers.

It would help to know first what Hawaii Energy is.

In July 2009 the Hawaii Public Utilities Commission decided to have a third-party company run its energy efficiency/rebate program, which had been managed by HECO. The company selected was SAIC (Science Applications International Corp.), which later became Leidos Engineering LLC.

Hawaii Energy is "ratepayer-funded," which means a surcharge on your monthly HECO bill — the "public benefit fund" — pays for the cash rebates and other incentives offered residents and businesses for installing energy-efficient equipment.

Hawaii Energy also offers education and training for residents, businesses and trade allies to encourage energy conservation and efficiency measures, said Caroline Carl, residential program manager at Hawaii Energy.

Among its programs is home energy reports, designed to promote conservation and help customers manage their monthly electricity bills, she said.

The Honolulu-Star Advertiser

"Kokua Line"

April 30, 2014

(Page 2 of 2)

The PUC has authorized Hawaiian Electric Companies (HECO, Maui Electric and Hawaii Electric Light) to provide customer electric usage information from the counties of Honolulu, Hawaii and Maui. Hawaii Energy is independent of the electric utilities, Carl said.

She said households are randomly selected and do not necessarily include homes on the same street. Homes that are chosen are nearby and have similar energy needs, comparable home size and age, etc.

The electricity usage information provided to Hawaii Energy does not include the number of people in a household nor whether the household is considering a solar system, she said.

However, participants can update their energy report profile online to reflect their household's characteristics at www.hawaiienergy.com/homeenergyreport.

Carl explained that the program does not evaluate energy savings by individual household, but rather calculates energy savings on an aggregate basis by county.

Savings calculations are provided in Hawaii Energy's Technical Resource Manual and are published yearly in Hawaii Energy's annual report.

The Technical Resource Manual Report for 2012 (Page 50) and the annual reports for 2012 (Page 104) and 2011 (Page 82) are online at www.hawaiienergy.com/information-reports.

The savings are consistent with similar peer group comparison programs nationwide, Carl said.

Participate or Not

Hawaii Energy selected 57,500 households to receive four reports for the year ending June 30: one report per month for the first three months and one report three months later.

The same households will continue receiving reports in the next program year, July 1 to June 30, 2015. Reports will be sent every other month for a total of six reports.

There are no plans to add more households at this time, but names can be placed on a wait list for consideration when the initiative is up for expansion or renewal, Carl said. While households cannot opt in to participate, they can choose to opt out any time, she said.

To opt out, go to the "My Account" section at www.hawaiienergy.com/homeenergyreport or call toll-free [877-231-8222](tel:877-231-8222). Anyone with questions about their reports can call Hawaii Energy at 537-5577.

WEfficiency: Crowdfunding to help non-profits

May 30th, 2014

By Nina Wu

Crowdfunding is such the thing to do these days.

Now, with the **Blue Planet Foundation's launch of WEfficiency**, you can donate or loan money to a non-profit group, specifically with the intention of helping it become more energy-efficient.

It's a win-win because a \$1 donation can turn into \$4 in energy savings. A \$10,000 lighting retrofit, for example, can save the non-profit up to \$40,000 over its lifetime. The non-profit's investment in energy efficiency measures results in immediate energy savings.

You can opt to give the non-profit a loan (called a "loanation") and get your money back, or you can give an outright donation.

The Green Leaf
Honolulu Star-Advertiser's Blog

The first three non-profits that are giving WEfficiency a shot are **YWCA Laniakea**, **Damien Memorial School** and **Hawaii Public Radio**.

To boost the kick-off of WEfficiency, **Hawaii Energy**, a ratepayer-funded energy conservation program, is offering matching "loanations."

Gov. Neil Abercrombie joined **Honolulu Mayor Kirk Caldwell** and the Blue Planet foundation board of directors in presenting the first "loanations" to representatives from the three non-profit groups last Thursday (May 22) to kick off the program.

In 2013, WEfficiency, which was developed by Honolulu-based solutions agency **Sudokrew**, was formally recognized as a **Clinton Global Initiative Commitment to Action**.

To make a "loanation," visit www.wefficiency.org.

Free pilot energy program

June 4th, 2014

By Nina Wu

Hawaii Energy and People Power are looking for 600 Oahu residents to test out its home energy management system for a year. For free. Courtesy image.

Ouch. The Hawaiian Electric Co. is **raising everyone's monthly bill by an average of \$4.89** as part of a "decoupling" move. It won't matter whether you used more or less for the month — everyone is going to have to foot that extra fee. That's the bad news.

But there's some good news.

The Green Leaf
Honolulu Star-Advertiser's Blog
Page 2 of 2

There's a cool technology being offered by **Hawaii Energy** (a ratepayer-funded conservation and efficiency program) in partnership with a Palo Alto, Calif.-based tech company called **People Power**. And they're offering it for up to 600 Oahu residents, for free.

That's right. Free.

There's not much you can get for free any more these days. **People Power** is looking for 600 Oahu residents to test out a home energy management system for a year, which can potentially save participants as much as 20 percent on their electric bill. The system comes with a mobile app — called **Presence** (which turns iOS devices into remotely monitored video cameras) — and **Monster Central** smart plugs. They're valued at about \$300 or more.

By the end of the program, participants get to keep the **Presence Pro Energy kit**.

But there are only about half of the spaces left, and you do need to qualify.

To qualify, you need a smartphone or tablet, a home WiFi connection with an available port on your Wireless Internet router. You can still qualify even if you have solar water or solar PV.

Sign up at www.Oahu.PresencePro.com.

Summer Energy Saving-Tips

Hawaii Energy Historical Summary

Program Year 2009 – *Smooth Transition*

On July 1, 2009, responsibility for the “demand-side management” programs was transferred from the electric utilities to a third-party Public Benefits Fee Administrator (PBFA) reporting directly to the Hawaii Public Utilities Commission (PUC). The scope and goals of the contract were developed to provide a focus to the energy efficiency and conservation efforts supporting the PUC’s Legislative charge to meet the State of Hawaii’s Energy Efficiency Portfolio Standard. The goal of the program in its first year was to provide a smooth and seamless transition of the programs to ensure that the obligations and commitments to customers and the efforts of trade ally businesses were supported during the transition.

In the first year, the Program accomplished much, while acknowledging areas to improve, specifically:

Achievements

- Provided a smooth transition of responsibilities from the utilities.
- Developed an identity with a new name, logo and program website.
- Enlisted trade allies and community-based organizations to support the Program’s education, outreach and marketing efforts.
- Discontinued window air conditioner (A/C) program.
- Expanded ENERGY STAR® Appliance programs across all Islands.
- Standardized Commercial Program requirements and incentive levels across all Islands.
- Delivered \$11,900,000 in incentives driving customer bill savings of over \$29,200,000 annually and over \$255,000,000 over the life of the measures installed.
- Verified first year Program Level savings of 153.7 GWhs.

Lessons Learned

- Need for increased efforts and methods to meet Island Equity goals.
- Need for program to enhance “Hard-to-Reach” participation.
- Provide for the ability to overcome economic impacts of the 2008 financial crisis.

Significant Event

- State mandate for Residential Solar Water Heating in new construction single-family homes.

Program Year 2010 – *Refinement and Additions*

In its second year, Hawaii Energy sought to refine programs to increase cost effectiveness and impacts. One method was to best leverage existing contractor relationships and refine processes to expand participating manufacturers, distributors and retailers to provide more efficient products to more locations at prices that could drive purchases.

The Program moved quickly to help the State secure and implement Federal Stimulus Funding in 2011 while addressing the needs identified to help hard-to-reach and commercial projects.

Implementation

- Initiated American Recovery and Reinvestment Act (ARRA) - funded projects.
 - Direct Implementation
 - Refrigerator Recycling Program to address “garage” or second refrigerator
 - Commercial Project Catalyst – 25% project cost

- Residential Peer Group Comparisons
- Solar Water Heating Loan Interest Buy-Down Program – Leveraging local financial institutions
- Solar Water Heating Bonus –Increased to \$1,000 per system
- Supported Activity
 - State of Hawaii Office of Community Services (OCS) Weatherization Program – Hawaii Energy provided solar water heating system inspections for low-income homes.
- Central plant optimization commissioning program to pursue operational and low-cost savings in air conditioning systems.
- Developed prescriptive commercial measure for Variable Refrigerant Flow installations to promote adoption of this technology.

Achievements

- Supported the delivery of 1,798,633 CFLs into homes (66% increase over PY09).
- Successfully reached Island Equity Goals.
- Hired dedicated representatives for Maui and Hawaii counties.
- Delivered over \$13,700,000 in incentives driving customer bill savings of over \$48,100,000 annually and \$473,200,000 over the life of the measures installed.
- Verified first year Program Level savings of 106.5 GWhs.

Lesson Learned

- The need to provide long-term support for projects in the initial phases to allow for customers’ engineering, design, procurement and budgeting cycles.

Significant Event

- Federal ARRA grants

PY11 – Focus on Hard-to-Reach

In its third year, the Program addressed the need to provide outreach and energy education through portfolio offerings such as “Sharing the Aloha”, which presented workshops in hard-to-reach communities, training for grade school educators, who in turn would convey the knowledge to their students and training for professional energy certification.

The Program also initiated 100% granted incentives for small businesses and restaurants. This program overcame technical, financial and trust barriers to implement lighting projects for these underserved electric customers.

Hawaii Energy reached out to non-profit organizations in Hawaii and Maui counties for grant-based incentive opportunities in solar water heating. This effort resulted in over 50 “in-need” homes receiving solar water heating systems that for various reasons did not qualify for other funding opportunities (e.g., ARRA, Weatherization Assistance Program (WAP), etc.).

Implementation

- Introduced “Transformational” energy education and awareness programs
- Developed residential Solar Water Heater grant program
- Grassroots organization-supported CFL exchanges
- Small Business Direct Install Program

Achievements

- Greater program recognition through media efforts.
- First-implemented AOA submetering project after two years of customer and program efforts.

- Responded quickly to market opportunities to create and execute Garage Active Ventilation Controls within the program year.
- Conclusion of offerings created and/or enhanced through the additional funding from ARRA grants provided through the State Energy Office
- Delivered over \$17,083,253 in incentives driving customer bill savings of over \$51,671,208 annually and over \$407,587,061 over the life of the measures installed.
- Verified first year Program Level savings of 130.1 GWhs.

Lessons Learned

- Developed experience leveraging the great work and expertise of third-party organizations within their specific communities or professions.

PY12 – Beyond Rebates: Expertise, Market Identification and Scale

In the fourth year, the Program issued a record \$21,814,052 in direct incentives and services to customers. Accomplishing this milestone was the culmination of prior program year efforts and execution of targeted pilot measures.

The Solar Water Heating Grant (100% incentive) offering with Hawaii Community Economic Opportunity Council (HCEOC) was completed this year with 169 systems installed for “in-need” homes. This effort was the result of a year-long collaboration among HCEOC, the Program and its trade allies.

Another major collaboration of the Program and its trade allies was the Direct Install Lighting programs that reached 583 small businesses and restaurants providing a lifetime energy cost reduction of \$26,738,793.

The Program extended its expertise gained over the past three years through market intelligence and data analysis of incented projects. By gaining a better understanding of the operational and physical conditions of energy-consuming systems, as well as revealing non-technical barriers, the Program was able to overcome various obstacles (e.g., funding gaps, job responsibilities, team capability or expertise in energy management) with offerings of training, equipment, targeted technical support and traditional financial incentives to help specialized sectors realize their opportunities for energy savings.

Implementation

- The Transformational program reached 600 government employees, 262 educators, 473 professionals and 2,733 residents.
- At the request of the PUC, Hawaii Energy began a program to support energy efficiency initiatives within the water and wastewater treatment and distribution sector. The Program visited over 38 facilities across all counties to identify opportunities for energy efficiency investments and to identify other needed technical support for management and operations personnel. One of the first areas of Program-funded support was the provision of metering equipment and training to assist in the counties’ water and wastewater agencies’ efforts to optimize pump efficiency.
- Hawaii Energy began supporting the design of the On-Bill Financing Program with an eye on leveraging synergies brought about by its expertise in energy efficiency measures and economics.
